ABSTRACT

This report provides a set of Canadian forest fire statistics for the period 1961 to 1966. Data for 43,796 fires from every fire control agency in Canada were processed and stored on magnetic tape. This report contains statistics on fire occurrence and fire suppression. Under occurrence, the number of fires are tabulated with respect to time and location of occurrence, and cause. Occurrence probabilities are related to the Canadian forest fire weather index. Under suppression, distributions and summary statistics are presented for fire areas, suppression times, costs and damages, and fire-to-lake distances.

RESUME

Ce rapport fournit une série de statistiques sur les incendies forestiers au Canada pour la période qui s'étend de 1961 à 1966. Les données, obtenues de tous les organismes canadiens de protection contre le feu, portent sur 43,796 incendies et ont été traitées et emmagasinées sur bande magnétique. Ce rapport renferme des statistiques sur la fréquence et sur la suppression des incendies. Dans la section qui traite de la fréquence des incendies, les feux sont classifiés selon le temps et le lieu du feu et selon la cause. Les probabilités d'incendie sont reliées à l'Indice forêt-météo, méthode canadienne. Sous le titre "suppression des incendies", l'auteur donne les distributions et les statistiques sommaires sur l'étendue des incendies, sur le temps nécessaire à la suppression, sur les coûts et dommages et, sur les distances feu/lac.

LIST OF TABLES

Table		Page
1	Number of Fires per Year	3
2	Number of Fires per Region per Year	4
3	Number of Fires per Ranger Station per Year	5
4	Number of Fires per Year by Day	9
5a	Number of Man-Caused Fires per Year by Day of the Week	17
5b	Number of Lightning Fires per Year by Day of the Week	17
6	General Cause	20
7	Specific Cause	20
8	Type of Person	21
9	Reported By	21
10a	Average Number of Man-Caused Fires per 1,000 Square Miles per Day versus the Fire Weather Index (FWI).	24
10b	Average Number of Lightning Fires per 1,000 Square Miles per Day versus the Fire Weather Index (FWI).	25
11a	Average Number of Man-Caused Fires per 1,000 Square Miles per Day versus the Fine Fuel Moisture Code (FFMC).	27
11b	Average Number of Lightning Fires per 1,000 Square Miles per Day versus the Fine Fuel Moisture Code (FFMC).	28
12	Total Number of Fires by Hour of Detection	30
13	Fire Area Distributions	31
14	Fire Area Statistics	32
15	Event Time Distributions	33
16	Event Time Statistics	34
17	Elapsed Time Distributions	35

5	Average Number of Fires per 1,000 Square Miles per day as a Function of the Fine Fuel Moisture Code.	26
6	Percent of Fires by Hour of Detection for Canada	29

ACKNOWLEDGEMENTS

Without the basic fire report data, the statistics presented in this report could not have been produced. The authors, therefore, wish to thank every provincial forest fire control agency in Canada who, without exception, granted access to whatever fire data were available. In all cases, agency representatives generously assisted in gathering the data, whether in the form of copies of fire reports or computer files. It is hoped that the spirit of cooperation exhibited with respect to this project will serve as a model for future Canada-wide fire research efforts.

Closer to home, the authors wish to express their appreciation to Mrs. A. Laing for typing the manuscript and some of the tables. They would also like to thank Mr. Neil Bruce for his editorial comments.

PREFACE

The reader will note the use of English rather than metric (SI) units. Processing the original data began in 1969, well before metric conversion was instituted. The tables presented here were gradually developed, on a low-priority basis, over several years. Due to impending major disruptions in the research program, however, it was felt by the authors that failure to immediately publish the tables in their current form might adversely affect their ultimate disposition. More specifically, a delay resulting from metric conversion would have jeopardized publication of the tables. Hence, the tables use the same units of measurement as appear on the original fire report forms.

CANADIAN FOREST FIRE STATISTICS:

1961-1966

A. J. Simard
G. A. Young

J. D. Graham
R. D. Redmond

INTRODUCTION

Forest fire control agencies in Canada have been keeping records of their activities in the form of individual forest fire reports for more than half a century. When considered in its entirety, the total amount of data collected is enormous. Unfortunately, usability of the data is severely limited by a number of problems. To begin with, the data are acquired by several different agencies and are stored in many different locations. There are as many data formats as there are fire control agencies. In addition, data formats frequently change over time. Lastly, many agencies do not use computer processing. Consequently, the user must transcribe the desired information by hand. There is little wonder that most forest fire research projects involving the use of individual forest report data have been limited to individual agencies.

In an effort to alleviate some of these problems, the Forest Fire Research Institute undertook a project to code selected data from individual forest fire reports for every fire which occurred in Canada between 1961 and 1966.^{1/} The selection of the end of the period was based on the fact that at the time of the inception of the project, 1966 was the most recent year for which computerized weather data was available in large quantities from the climatological branch of the Atmospheric Environment Service. The year 1961 was chosen as the beginning because it was a particularly bad fire year. (Lockman, 1967).

While the statistics presented herein are not as up-to-date as would be desired, they represent a one-time opportunity to examine fire control across Canada in some detail. Certain statistics such as costs and losses change significantly with time. In such cases the information provided in this report is useful primarily as data from a base period, against which current statistics can be compared. Other statistics such as fire causes change slowly with time and may, therefore, still be applicable today. To determine the degree of current applicability or the amount of adjustment needed to render the data found in this report applicable to today's conditions, the reader is referred to "Forest Fire Losses in Canada" (Lockman, 19__). Finally, certain information, such as fire-to-lake distances, do not change with time and the information provided herein is as relevant today as it was in the early 1960's.

^{1/} Data for Prince Edward Island were not available for the period of study.

In all, data from 43,796 fires were processed and stored on magnetic tape. The data processing procedure is described in detail by Simard et al. (1973). The purpose of this report is to present a summary of statistics for the six years of data. Only the simplest and most generally applicable statistics are presented. The number of combinations of statistics that could be gathered is so large as to be limitless. Consequently, summaries other than those mentioned in this report will be compiled only as required.

This report contains fire occurrence and fire suppression statistics. Under fire occurrence (Tables 1-12), the number of forest fires is summarized with respect to time of occurrence, location, and cause. Occurrence probabilities are related to the Canadian Forest Fire Weather Index. Under fire suppression (Tables 13-21), distributions and summary statistics for fire size, suppression time, suppression cost, damage, and fire-to-lake distance are presented. In most cases, the statistics are given on both a provincial and a national basis.

The information is presented without comment, interpretation, or analysis as the nature of these activities are dependent on the purposes of the user. The authors have simply compiled a set of statistics which describe selected aspects of fire suppression across Canada. It is hoped that the information will be useful to other investigators in the field.

Table 2. Number of Fires per Region per Year.

This table lists the average number of fires by forest region and province. In cases where regional boundaries changed during the period of tabulation, the most recent boundaries were used. Due to rounding off, the total number of fires per province per year may not equal one-sixth of the totals shown in Table 1. Data for individual years by region are available but are not included in this report. See Appendix IV in Simard et al. (1973) for a complete list of region names.

Table 3. Number of Fires per Ranger Station per Year.

This table lists the average number of fires per year for each ranger station by province. Due to rounding, the total number of fires per province may not equal one-sixth of the totals given in Table 1. Data for individual years by ranger station are available but are not included in this report. See Appendix IV, in Simard et al. (1973) for a complete list of station names and locations.

Table 4. Number of Fires per Year by Day.

This table lists the average number of fires by date, month, and province. It also includes a total for Canada by date as well as the percent of fires which occurred each day. The number of fires for each month is also given by province. Figure 1 illustrates the data given in Table 4.

Table 5a. Number of Man-caused Fires per Year by Day of the Week.

This table lists the average number of man-caused fires per year by day of the week and province. Totals for Canada and the percent of observations by day are also listed. Figure 2 illustrates the totals for Canada.

Table 5b. Number of Lightning Fires per Year by Day of the Week.

This table gives the average number of lightning fires per year by day of the week and province. Totals for Canada and percent of observations by day are also shown. While the percentages of man-caused and lightning fires add up to 100 percent, the total number of observations is less than one-sixth of the previous totals due to the exclusion of fires of unknown origin.

Table 6. General Cause

This table lists the total number of fires by general cause and province. Totals for Canada as well as the percent of fires by general cause are also given. Dividing the totals by six gives the average number of fires per year by general cause. The data in Table 6 are illustrated in Fig. 3a.

Table 7. Specific Cause

This table lists the total number of fires by specific cause and province. Totals for Canada as well as percent of observations by specific cause are also given. Dividing the totals by six gives the average number of fires per year by specific cause. The data in Table 7 are illustrated in Fig. 3b.

Table 8. Type of Person

This table lists the type of person believed to have started fires by province. Totals for Canada as well as the percent of observations for each type of person are also given. Dividing the totals by six yields the average number of fires per year by type of person. The data in Table 8 are illustrated in Fig. 3c.

Table 9. Reported By

This table lists the source of the initial report of forest fires by province. Totals for Canada as well as percent of observations by reporting agency are also given. Dividing the totals by six yields the average number of fires reported each year by each agency. The data in Table 9 are illustrated in Fig. 3d.

Table 10a. Average Number of Man-Caused Fires per 1,000 Square Miles per Day versus the Fire Weather Index (FWI).

This table indicates the expected occurrence frequency for man-caused fires per day per unit area ($1,000 \text{ mi.}^2$) as a function of the FWI. Individual data for each province are given. To obtain the national average, provincial data were normalized, using the unweighted averages given at the bottom of Table 10a. Normalization was required because of the large differences in occurrence probabilities between provinces. A dash, in this and all subsequent tables, indicates insufficient data. The average occurrence probability for Canada is plotted in Fig. 4.

Table 10b. Average Number of Lightning Fires per 1,000 Square Miles per Day versus the Fire Weather Index (FWI).

This table indicates the expected occurrence frequency for lightning fires per day per unit area ($1,000 \text{ mi.}^2$) as a function of the FWI. Individual data for each province are given. The national average was obtained in the same way as for Table 10a. The average occurrence probability for Canada is plotted in Fig. 4.

Table 11a. Average Number of Man-Caused Fires per 1,000 Square Miles per Day versus the Fine Fuel Moisture Code (FFMC).

This table indicates the expected occurrence frequency for man-caused fires per day per unit area ($1,000 \text{ mi.}^2$) as a function of the FFMC. Individual data for each province are given. The national average was obtained in the same way as for Table 10a. The provincial averages given in Tables 10a and 11a are not comparable because they are unweighted data and are obtained from different distributions. The average occurrence probability for Canada is plotted in Fig. 5.

Table 11b. Average Number of Lightning Fires per 1,000 Square Miles per Day versus the Fine Fuel Moisture Code (FFMC).

This table indicates the expected occurrence frequency for lightning fires per day per unit area ($1,000 \text{ mi.}^2$) as a function of the FFMC. The national average was obtained in the same way as for Table 10a. The provincial averages given in Tables 10b and 11b are not comparable because they are unweighted and are obtained from different distributions. The average occurrence probability for Canada is plotted in Fig. 5.

Table 12. Total Number of Fires by Hour of Detection.

This table lists the number of fires detected during each hour of the day by province. Totals for Canada as well as the percentage of observations by hour are also given. Fires with missing data have been deleted from the sample. The data from Table 12 are plotted in Fig. 6.

FIGURE 6. PERCENT OF FIRES BY HOUR OF DETECTION FOR CANADA

Table 13. Fire Area Distributions.

This table lists the distributions of fire area for Canada, in terms of total number of observations and percent of the total by fire area class. The fire size distributions are tabulated at three points in the fire's history: at detection, at the start of suppression, and at control. The total number of observations for Canada is less than that for the previous tables, because fires without data have been deleted from the sample.

Table 13

Table 15. Event Time Distributions.

This table lists the distributions of time required for the three major fire control activities: travel time, fire suppression time, and mop-up time. Totals for Canada are given for the number of observations and the percent of the total for each time class. Fires with missing data have been deleted from the sample.

Table 20. Cost and Damage Statistics.

This table lists averages, standard deviations, and numbers of observations for suppression cost, equipment loss, forest damage, and nonforest damage. Data are given by province as well as for Canada.

Table 21. Fire-to-Lake Distances.

This table lists average fire-to-lake distances and standard deviations for five lake-length categories. The data are based on a random ten percent sample of all fires. Distances are listed by region and province. The number of observations is also given. See Appendix IV in Simard et al. (1973) for a complete list of region names.
