Abstract

Canada's Forest Inventory is a compilation of the most recent information on the extent and state of Canada's forest resources. It is based on existing provincial and territorial forest inventories and satellite imagery, and is revised periodically to reflect the most recent data available. Canada's Forest Inventory 2001 (CanFI2001) is based on contributions from federal, provincial and territorial government agencies. It is stored in a relational database and geographic information system that provides statistical reporting, mapping and spatial-analysis capabilities. CanFI2001 replaces Canada's Forest Inventory 1991: The 1994 Version (CanFI1991).

The 2001 National Forest Inventory includes a revised land classification, an expanded species list, expanded coverage to include the entire land mass of Canada and an estimation of forest biomass.

This report represents a summary of data available.

Résumé

L'Inventaire des forêts du Canada est une compilation de l'information la plus récente sur l'étendue et l'état des ressources forestières du Canada. Il repose sur les inventaires des forêts provinciaux et territoriaux existants ainsi que sur les images satellites, et il est régulièrement révisé afin de présenter les données les plus récentes connues. L'Inventaire des forêts du Canada 2001 (IFCan2001) se fonde sur les contributions des agences gouvernementales fédérales, provinciales et territoriales. Il est stocké dans une base de données relationnelles et dans un système d'information géographique et il permet de produire des rapports statistiques, des cartes et des analyses spatiales. L'IFCan2001 remplace le Canada's Forest Inventory 1991: the 1994 Version (appelé IFCan1991).

L'Inventaire forestier national 2001 comprend une classification révisée de la couverture terrestre, une liste étendue des essences, une présentation plus élargie qui inclut la totalité de la masse terrestre du Canada, ainsi qu'une estimation de la biomasse forestière.

Ce rapport représente un résumé des données disponibles.

Acknowledgements

The authors gratefully acknowledge provincial and territorial forest inventory staff for providing and, in some cases converting, data: Paul White (Newfoundland and Labrador), Colleen Brothers (Nova Scotia), Bill Glen (Prince Edward Island), Bob Dick and John Upshall (New Brunswick), Robin Lefrancois (Quebec), Frank Addante (Ontario), Gerry Becker (Manitoba), Xilin Fang (Saskatchewan), Ken Dutchak and Daryl McEwan (Alberta), Tim Salkeld (British Columbia), and Pat MacDonell and Jessie Devost (Yukon).

Joe Lowe's (1934–1996) vision for a National Forest Inventory for Canada was carried forward by Steen Magnussen; it was brought into being with the capable and invaluable data-conversion assistance of summer and co-op students Tom Arkinstall, Tamara Brierley, Becky Davis, Sean Fadum, Jacob Guercio, Luke Holden, Norman Sim, Mark Szilveszter, Kelly Wallace and Tracy Young. Stephen Gray's expertise in data extraction for analysis and understanding of the data also aided greatly in the preparation of a clean, error-free data set. He prepared data for map production and drafted data summaries for tables. Dennis Clarke prepared and assisted in the design of maps. Paul Boudewyn and Alex Song developed the biomass estimation, and Paul prepared the text describing biomass-estimation procedures and the resulting biomass data set. The authors gratefully acknowledge the time and effort that these and others contributed to the project—it would not have been possible without them.

Finally, the authors appreciate the comments of reviewers Brian Haddon, Ken Mallett, Hubert Bunce and Simon Bridge, and wish to thank them for their time and efforts.

Highlights

- Canada's forests contain just under 29.4 billion m^3 of merchantable wood volume.
- Canada has an estimated 29.6 billion tonnes of biomass, with 27.3 billion tonnes on forest land.
- Of Canada's total area (998 million ha) *
  - 40% is forest and other wooded land;
  - 31% is forest land.
- Of the forest land (310 million ha), the ownership pattern is:
  - 78% provincial;
  - 14% federal (including the territories);
  - 8% private.
- Of the stocked forest area (275 million ha), the forest type distribution is:
  - 66% softwood;
  - 22% mixedwood;
  - 12% hardwood.
- Of the stocked forest volume (29.4 billion m^3), the species distribution is:
  - 77% coniferous;
  - 23% broad-leaved.
  - Spruce, pine, balsam fir and aspen/poplar are the major species.
- Of the stocked forest area, an estimated:
  - 31% is young;
  - 37% is mature or overmature;
  - 32% is uneven aged or unclassified for maturity.

* This figure is the official area of Canada (from Statistics Canada); the value from the CanFI2001 database is slightly less (979 million ha) due to the various data sources and their resolutions.

1. Introduction

Canada has national and international commitments to report on forest resource information to the State of Canada's Forests report to Parliament, the National Forestry Database Program's Compendium of Canadian Forestry Statistics, the United Nations Global Forest Resources Assessment, the Intergovernmental Panel on Climate Change, the Montreal Process's Criteria and Indicators of Sustainable Forest Development and others. In order to meet these commitments, a reliable central source for data is required. Canada's Forest Inventory provides these data in the form of tabular summaries, maps and extracted subsets of the data. Besides providing information to meet Canada's reporting commitments, the database provides data to other clients, such as government agencies, universities, non-governmental organizations, environmental non-governmental organizations and anyone interested in knowing more about Canada's forests.

Canada's Forest Inventory 2001 (CanFI2001) is a compilation of different data sources into a common format. Data sources include detailed, stand-level vegetation and forest resource inventories from the provinces, territories and other jurisdictions, ecological land classifications, and classified satellite imagery. The process for producing CanFI2001 was established for the production of the 1981 national forest inventory and carried through the 1986 and 1991/94 national forest inventories. The approach is cost effective in that it is based on existing data and requires no additional data collection, and the process is well established and accepted by the contributing agencies.

CanFI provides detailed information about Canada's forests consistent with forest management information. However, the resulting national picture of Canada's forests lacks information on the nature and rate of changes to the resource, does not reflect the current state of the forests, and cannot be used as a satisfactory base to monitor change. Nor can changes in the forest resource be derived from a comparison of successive national forest inventory reports.

This report describes the inventory, how it was created, and what it contains. It describes each attribute in the database, and provides inventory results in the form of tables, maps and graphics. Summaries for forest regions, for terrestrial ecozones and for the boreal region of Canada are presented. As a feature analysis, the inclusion of protected areas in CanFI2001 is discussed and some results are presented. Finally, comparison with earlier versions of the inventory and other issues are discussed. Detailed summary tables are included in Appendix I; the data codes and descriptions are in Appendix II; Appendix III contains the data formats of the CanFI2001 database.

2. Description of Canada's Forest Inventory

2.1 General

Management of most of Canada's forest lands is a provincial responsibility. Forest management requires basic information about the location and extent of the forest resource. A forest inventory can provide this information. A forest inventory may be described as a survey of an area to determine the current location, extent, condition, composition, structure and volume of the forest resource. Provinces use different forest inventory systems for different forest management needs; for example, extensive reconnaissance-level inventories for exploratory purposes and strategic-level information, or operational inventories—detailed inventories of a specific area—for operational harvest planning.

The management inventory is the most prevalent and important kind of inventory used, because it provides data for longer-term forest management planning and decision making. The forest management inventory is a detailed and complete inventory of a management unit and includes complete-coverage forest-stand maps, based on interpreted aerial photography, and volume estimates, based on field sampling. Forest management inventories describe the volume, location and condition of the resource at a specific point in time. They are usually conducted in 10- to 20-year cycles. Often, by the time a new cycle begins,

standards, definitions and measurement protocols have changed. Provincial forest management inventory databases typically contain information from several inventory cycles.

Federal government responsibilities relating to forest inventory lie in the areas of research and development, the inventory of federally administered forest lands, and in the compilation and reporting of a national forest inventory. The current national inventory, Canada's Forest Inventory 2001 (CanFI2001), is a compilation of stand-level provincial data from forest management inventories. CanFI2001 is derived from a number of sources, including management, regional, and reconnaissance-level inventories, satellite imagery, and other surveys (e.g., ecological land classification of national parks). The latter two types of sources were used for areas where provincial forest management inventory data were not available.

In order for source data to be combined into CanFI2001, a national database format and coding scheme were developed. Protocols to convert each source dataset to CanFI2001 specifications were developed in cooperation with each data provider. These data are the attribute data in CanFI2001, which describes the land cover in each inventory summary unit using 16 classifiers and numerical attributes of area and wood volume.

Although the basic geographic summary unit of forest management inventories is the forest stand, forest-stand boundaries are not retained in CanFI2001. The basic geographic summary unit in CanFI2001 is the inventory summary unit (Figure 1), generally equivalent to a forest management inventory map sheet. Table 1 shows the range of areas of maps that are not along a coast or border, as used in CanFI2001. After each stand has been coded according to the national classifiers, similar stands are aggregated (i.e., the area and volume are summed). The number of records for each summary unit varies depending on the data source and the complexity of the land cover classes.

Besides storing attribute data in a relational database, CanFI2001 also stores the geographic data in a geographic information system (GIS) that contains summary-unit location information for mapping purposes. The GIS also allows summary units to be combined with other geographic data, such as forest regions, ecozones and road networks, for geographic analyses of attribute data.

2.2 Data Sources and Inventory Types

Data from 48 different sources from the 13 provinces and territories—totalling 58 inventory phases—make up CanFI2001. The inventory sources used in the creation of CanFI2001 (listed in Appendix I: Table I-1) can be grouped into five categories, ranked here from the newest and most detailed to inventories carried out for other purposes:

1. New forest or vegetation resource inventory (management inventory);
2. Older forest or vegetation inventory data resubmitted to CanFI (management inventory);
3. Data re-used from earlier version of CanFI (reconnaissance, regional or management);
4. Satellite imagery;
5. Other surveys.

Table 2, a summary of Appendix I: Table I-1, shows that, in CanFI2001, data for more than half the area of Canada are from satellite imagery, and more than a quarter are from new or newly submitted provincial and territorial inventories. About 12% of the data is re-used from CanFI1991, about 4% from old provincial or territorial datasets resubmitted and recoded to CanFI2001, and the remaining data originate from ecological studies of national parks or other studies, or were added by the Canadian Forest Service.

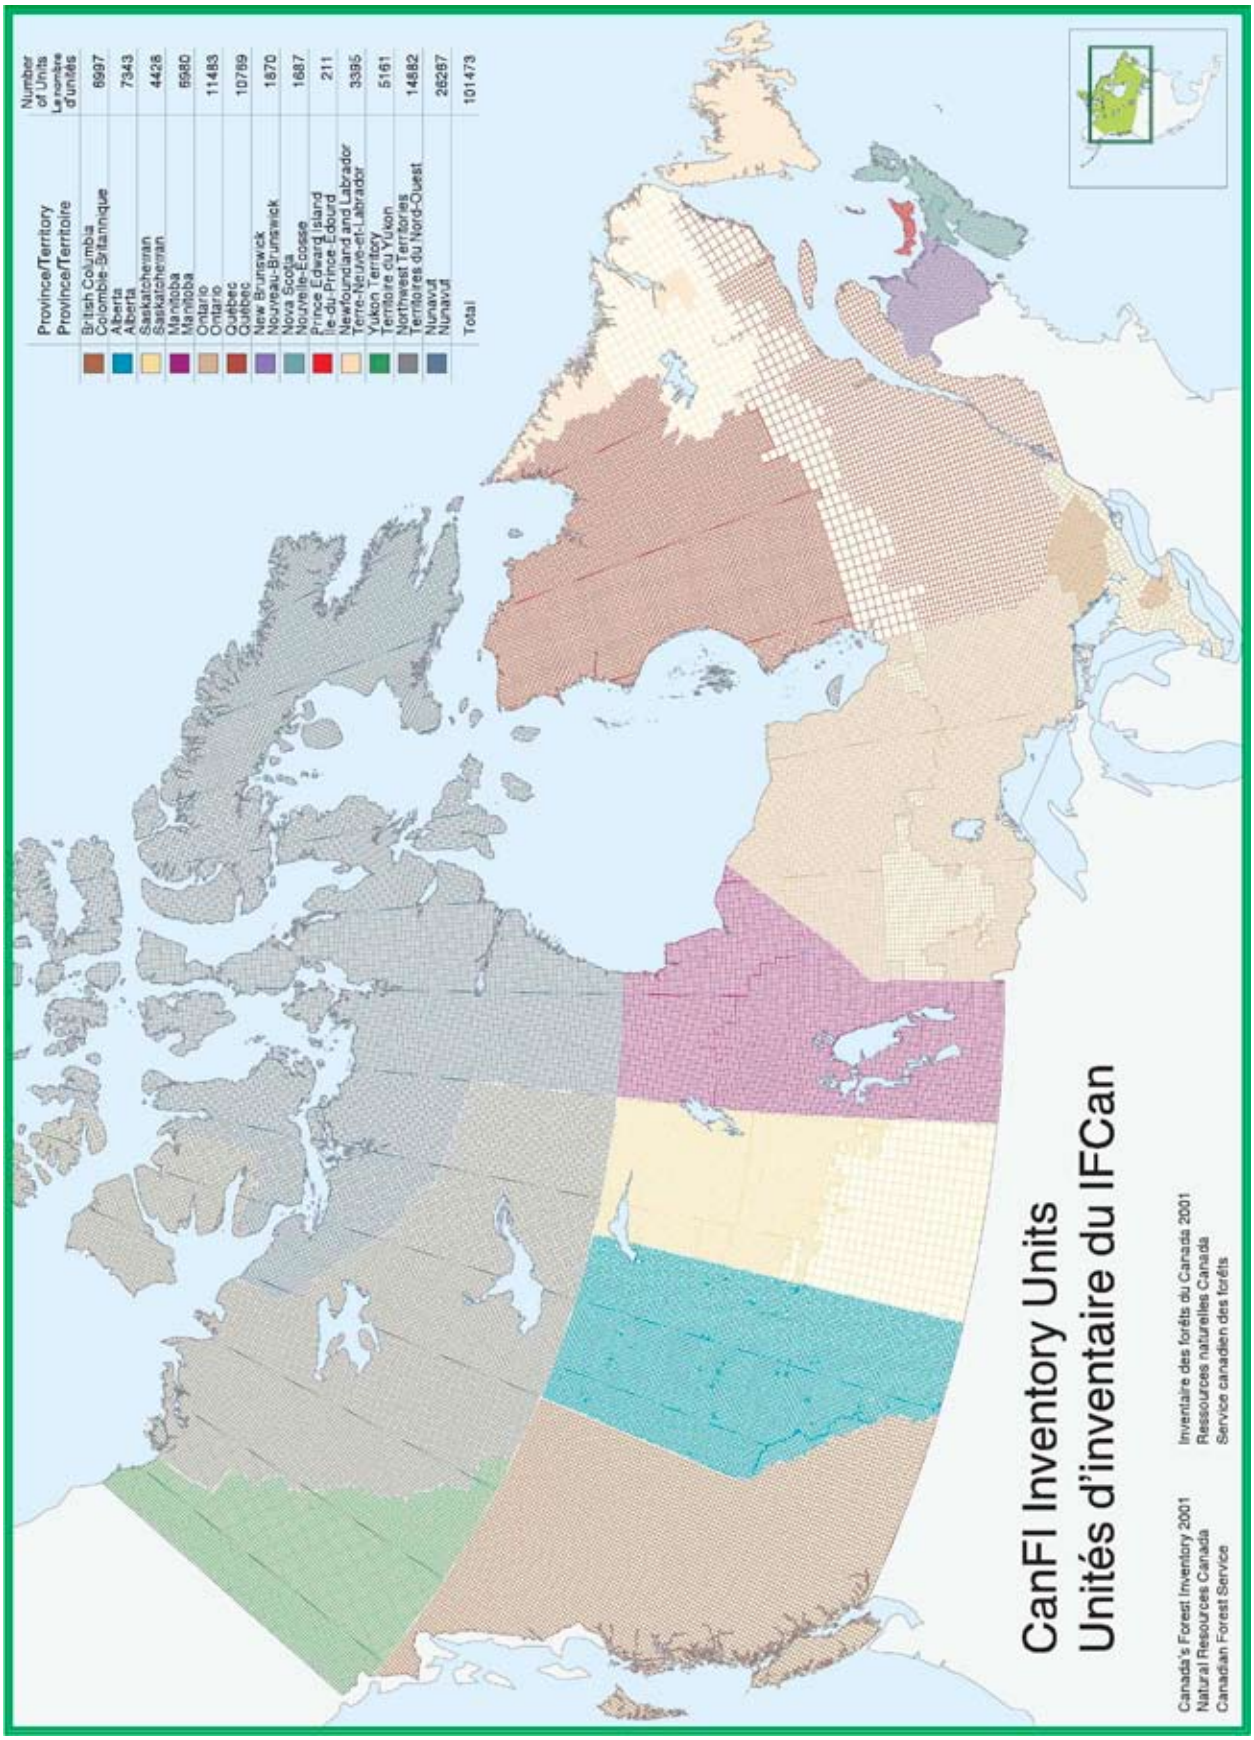

Figure 1. CanFI mapping units

New forest or vegetation resource inventory

These are data from detailed, intensive forest or vegetation inventories in which the forest types are usually mapped in detail with estimates given for each type (Haddon 1988). These inventories are compiled for management purposes to determine data such as area, condition, volume and species, and are usually created using information from aerial remote sensing platforms in combination with information from ground samples. In CanFI2001, these are either new inventories or inventories which have been developed with the use of models.

Older forest or vegetation inventory data resubmitted

These data are similar to, but older than, the data within new forest or vegetation resource inventories. These older inventory data were used in previous versions of CanFI, having been converted to the CanFI classifiers current at that time, but have since been converted to CanFI2001 classifiers and resubmitted. As land-cover classifiers are more detailed in CanFI2001, this allows capture of more detail from the source inventory than was stored in earlier versions of CanFI.

Data re-used from earlier versions of CanFI

These forest inventory data were re-used directly from earlier versions of CanFI: the source data were not re-converted to CanFI2001 classifiers.

Satellite imagery

This consists of data collected from space-based sensors. The resolution of the data as used in CanFI2001 varies with the sensor, from 30-m (Landsat data) to 1-km (SPOT-VGT and AVHRR data) resolution. The type of information collected is more generalized than that collected for management purposes, and does not include condition, species, or volume estimates.

These include SPOT–VGT (Systèm pour l'Observation de la Terre–VEGETATION), AVHRR (Advanced Very High Resolution Radiometry), Landsat data in Ontario, South Digital Land Cover data in Saskatchewan, Alberta Ground Cover Classification, Prairie Farm Rehabilitation Administration generalized landcover, as well as data for Wood Buffalo National Park. In Figure 2, these areas are represented as more recent datasets (up to 10 years old).

Other surveys

These include ecological land classifications of national parks (Gwaii Hanaas and Kouchibouguac national parks), the Native Prairie Vegetation Inventory in Alberta, and records added by the Canadian Forest Service (for the Great Lakes, Smallwood Reservoir, and other areas for which data were missing).

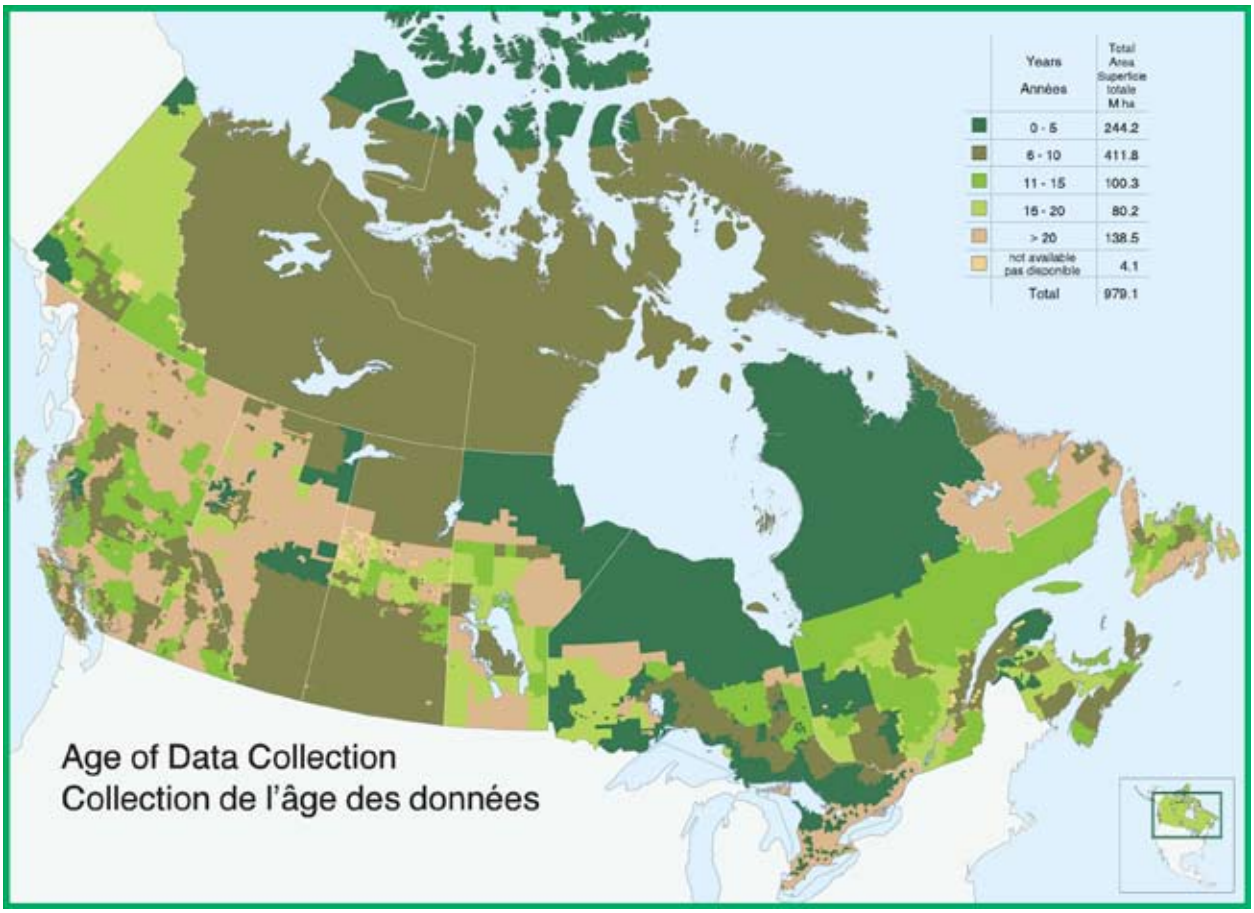

Figure 2. Age of data collection

2.3 Attribute Data

Attributes in CanFI2001 include area, volume, and biomass, according to 16 classifier classes for each summary unit.

The 16 classifiers are as follows:

1. Data source: a description of inventory type;
2. Ownership: land-ownership classes;
3. Status: control of land for timber harvesting;
4. Protection: land protection from human disturbance;
5. Land class: land cover description (increased from seven classes in CanFI1991 to 62 classes);
6. Site quality: land capability to grow trees;
7. Stocking class: density of trees on forested land;
8. Age class: age of forested stands (20-year classes) at the year of information collection;
9. Maturity class: maturity of forest stands for timber harvesting—a qualitative assessment;

10. Forest type: description of majority of trees in a stand as softwood, mixedwood or hardwood;
11. Predominant genus: most abundant tree genus in a stand;
12. First species: tree species listed first in stand composition;
13. Year of data collection: year in which data were obtained—usually the year of photography or satellite imagery;
14. Year of update: year during which photos or imagery were updated (for fires, harvesting, etc.) or during which growth in volume and change in some classifiers (e.g., age and maturity class) were modelled (British Columbia);
15. Volume type: a key to one of three ways in which volume data of zeros or missing-values codes have been replaced by average volumes for the same province, region and maturity class;
16. Inventory phase: a key to identify different sources of inventory within a province or territory.

Area is described in hectares. Volume is gross merchantable volume (volume of the main stem, excluding stump and top, but including defective and decayed wood) in all provinces and territories, except British Columbia, where it is net merchantable volume (defective and decayed wood is excluded). Volume data, as of the year of data collection or update, for up to 28 different species in a province or territory are stored as measurements in cubic metres per hectare, and are summarized as cubic metres for coniferous species, broadleaved species, and all species combined. The utilization specifications for volumes—that is, the tree-size limits below which trees are not considered in volume calculations—are listed in Appendix II. Biomass is measured in metric tonnes per hectare of above-ground, oven-dry biomass. Biomass-estimation procedures are described in Section 2.7.

2.4 Age of Data

More than 85% of the area of Canada is represented by data collected during the last 20 years; more than two-thirds (66.7%) of the data were collected between 1995 and 2003 (Figure 3). In CanFI2001, 14.4% of data was collected 30 or more years ago. Appendix I: Table I-1 lists year of data collection by inventory source; Figure 2 shows the distribution of data-collection age across Canada.

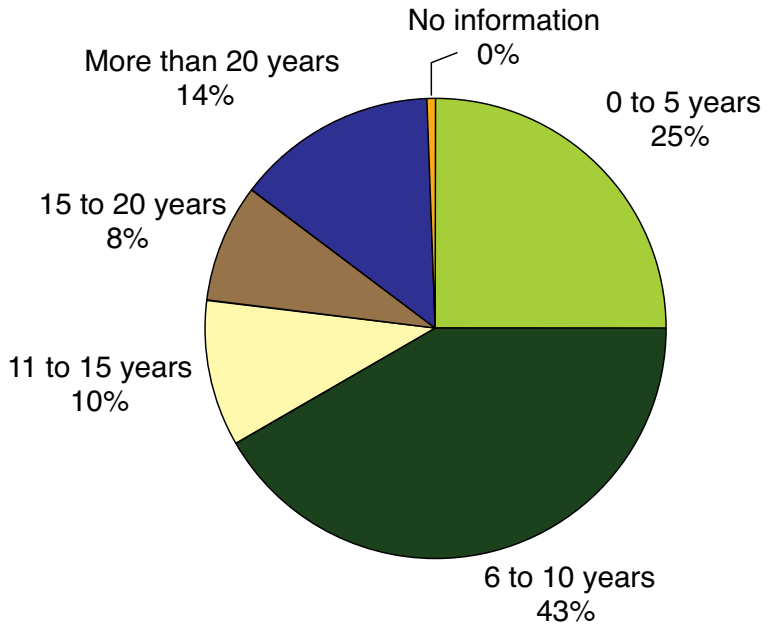

Figure 3. Age of data in CanFI2001

2.5 Geographic Data

The GIS stores boundaries of CanFI summary units according to each province and territory, as well as geographic data representing forest regions and forest sections (Rowe, 1972), terrestrial ecozones and ecoregions as defined by the Ecological Stratification Working Group (1995), the Canadian Road Network (from DigiMap Data Services, Inc., 1996, Toronto, Canada), and provincial and territorial boundaries, coastlines and lakes.

CanFI2001 contains 102 120 summary units. These vary, depending on data source, from 2 800 ha to 90 000 ha in size (Figure 1; Appendix I: Table I-2). The average summary unit area measures about 9 600 ha, or about 10 km by 10 km.

2.6 Data Compilation

Procedures for data compilation were as follows:

1. Attribute and GIS data were received from the data originators;
2. Protocols were developed to convert each source dataset to the national data format;
3. Converted data were checked for quality;
4. Converted data were checked against GIS coverage to ensure there were data for each mapping unit, and that GIS coverage was complete;
5. Errors were reported to the data originator;
6. Corrections were applied to the converted data, or revised source data were provided;
7. Once all data sets were correct, summary tables were created for signed approval by the data originators;
8. Final tables were created.

Figure 4 illustrates how stand-level data were aggregated to fewer and standardized records, including the change in scale from about 1:20 000 to 1:20 000 000. Original stand-level data usually has one record per stand. When each stand was classified to CanFI2001 specifications, many stands within a summary unit were similarly classified. These similar stands have been aggregated within summary units (their areas and volumes are summed) so that, at the summary-unit level, there is only one record for each grouping of stands with the same CanFI2001 attributes. Stand boundaries have not been retained in the CanFI2001 GIS coverage: the summary unit is the smallest geographic unit.

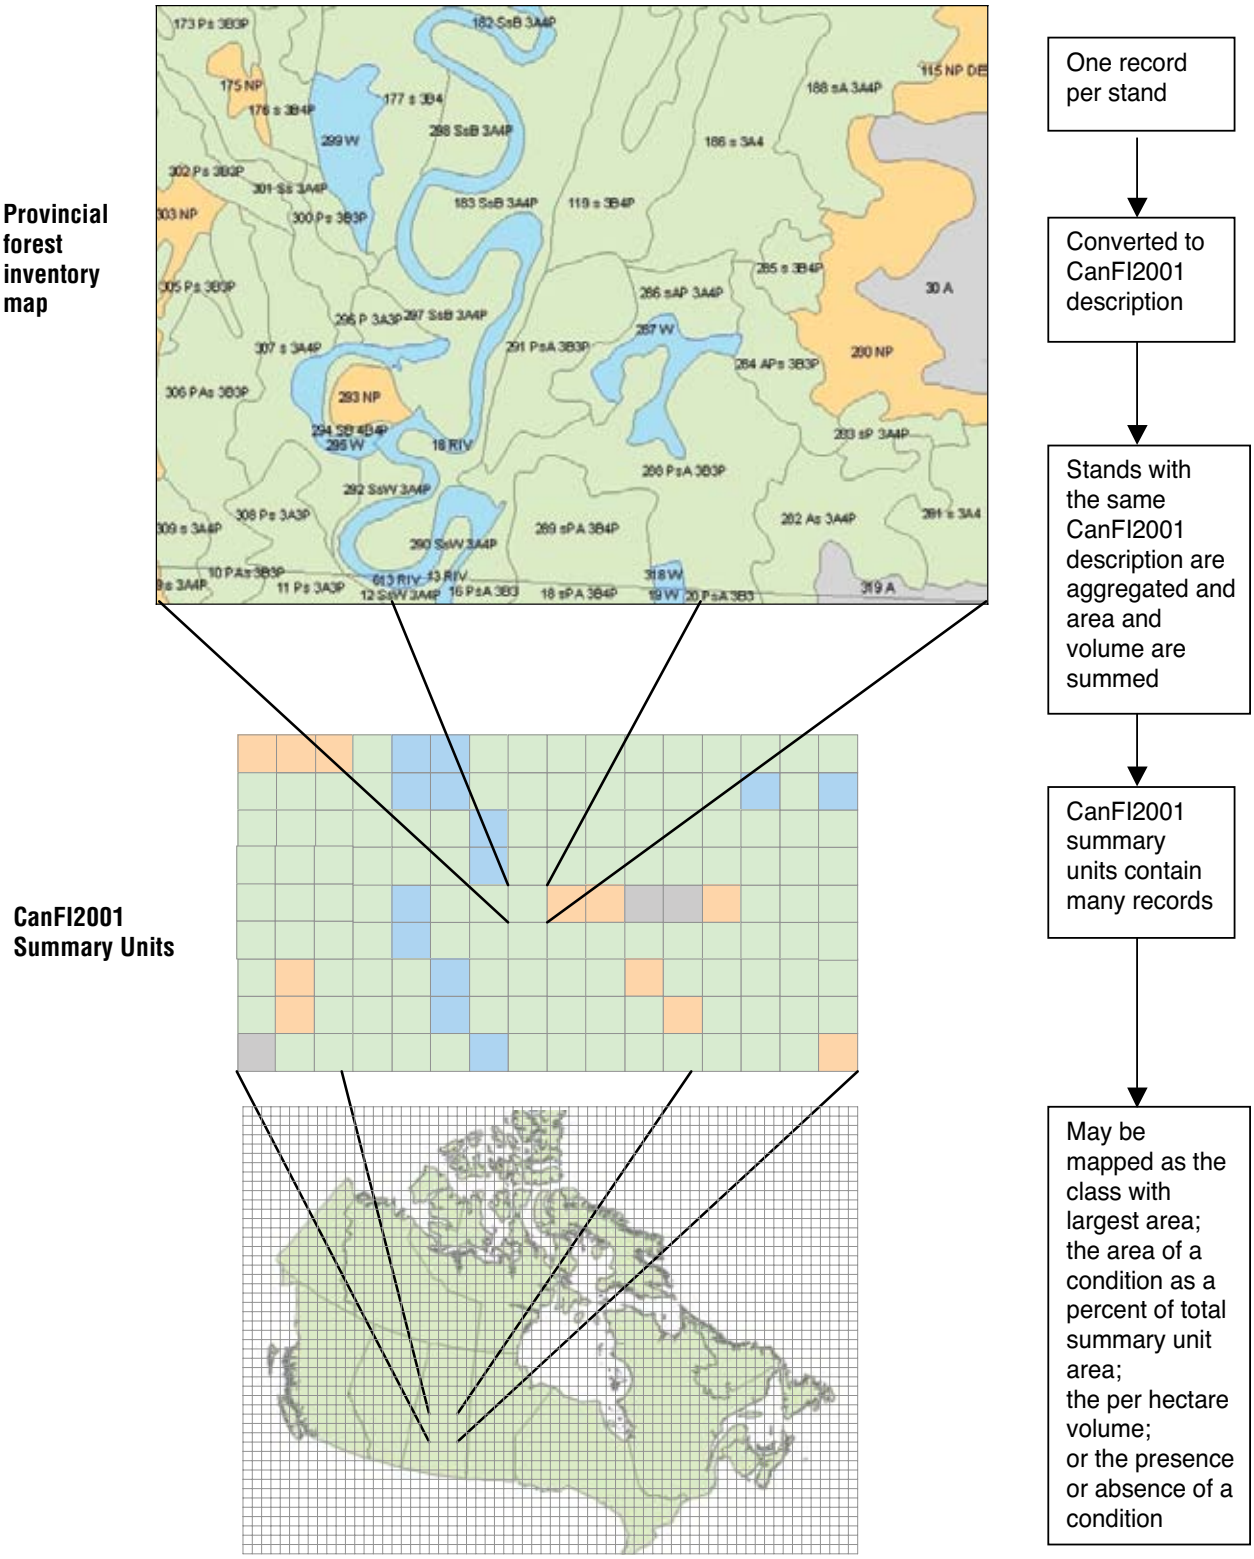

Figure 4. Stand-level data are reduced to fewer and standardized records

2.7 Biomass Estimation

Biomass by component (stem wood, stem bark, branches, foliage) has been predicted for every vegetated record in the CanFI2001 database. The methods used to estimate biomass reflect inherent characteristics of the database and availability of ground plot data. They were guided by an overall objective to derive empirical models that would logically convert volume to biomass where volume exists, or to relate biomass to land cover where volume does not exist. These methods can be grouped into four scenarios (Boudewyn, P.; Song, A.; and Gillis, M. Biomass estimation for vegetated areas of Canada. Natural Resources Canada, Canadian Forest Service, Victoria, B.C. Report in preparation.):

Scenario 1: gross merchantable volume exists (treed, merchantable stands). Figure 5 summarizes the methods used to estimate biomass by component for CanFI2001 records that contain volume.

Scenario 2: gross merchantable volume is missing, but should exist. Volume is first estimated from look-up tables that contain average volume per hectare by various combinations of classifiers represented in CanFI2001. The methods of Scenario 1 are then applied.

Scenario 3: vegetated treed land classes where gross merchantable volume is zero (treed, non-merchantable stands). Permanent sample plots and temporary sample plots that meet these criteria, along with published reports, were used to construct look-up tables of average biomass per hectare for various components by combinations of classifiers (ecozone and predominant genus).

Scenario 4: vegetated, non-treed records (e.g., grasslands, shrubs, muskeg). A database of published information on biomass of these areas was created and used to develop look-up tables of average biomass per hectare by combinations of land classes and ecozones.

Substitution guidelines were developed and implemented for combinations of classifiers that do not have models or look-up tables due to gaps in the permanent or temporary sample plot development and publication databases. Biomass is now summarized similarly to volume, and many of the tables shown throughout the report include sections for biomass, or separate biomass tables.

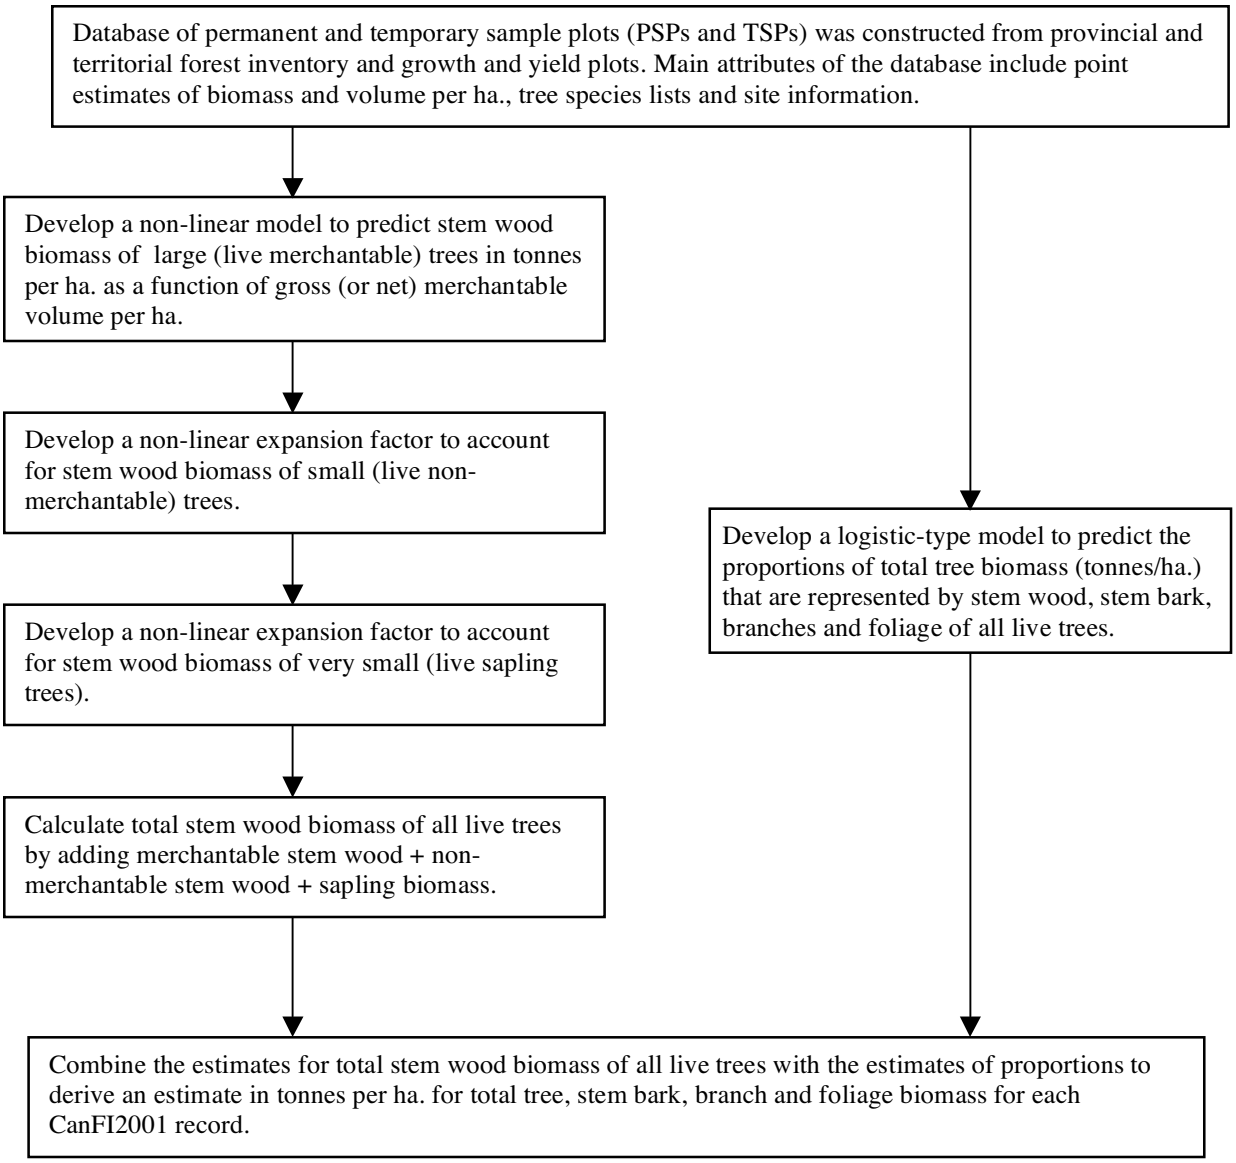

Figure 5. Generalized model development process.

2.8 Data Summaries and Display

Data in the CanFI2001 database can be summarized and displayed as tables and maps, or portions may be exported as text files for analysis by the client.

Tabular summaries can be created for the entire country, or for each province, forest region, ecozone or any other region that has been intersected with the summary unit coverage in the GIS. The attributes in the tables can be area, volume or biomass, expressed as units or percent, and can be presented in two- and three-way formats by various classifiers.

Mapping of data from CanFI2001 is based on a single value for each mapping unit. A mapping unit may be, for example, an inventory summary unit, an ecozone or a province. The data can be summarized in a number of ways to provide a value for a mapping unit: the condition with the most area in a mapping unit; the area of a condition as a percent of the total area of a mapping unit; the per-hectare volume or biomass; of a condition; or the presence (or absence) of a condition.

Clients such as the National Forest Carbon Monitoring and Reporting System, which models Canada's forests' carbon budgets, often require a subset of the CanFI data to do their work. Such subsets may be produced and displayed for a defined area (e.g., a group of ecozones), or for a selected set of classifiers.

3. Inventory Results

CanFI2001 is the first national forest inventory to cover the entire land mass of Canada. According to CanFI2001, the total area of land and fresh water in Canada is 979.1 million ha. This value varies by less than 2% from the value of 998.5 million ha reported by Statistics Canada (2005). The difference is due to the differing spatial resolutions of the data sources used.

Forest and other wooded land covers 402.1 million ha, representing 41% of the country, whereas the portion that is forest (310.1 million ha) makes up about 32% of Canada's area (Table 3). Figure 6 shows relative total area and forest and other wooded land by province. Nunavut has the largest total area, but only 0.8 million ha—the smallest area—of forest and other wooded land. Quebec and Ontario have more forest and other wooded land than British Columbia does, but the percentage of forest and other wooded land compared to the total provincial area is highest in British Columbia, at almost 68%, compared to 63% for Ontario and 56% for Quebec.

Of the total 29 383 million m^3 in wood volume, 77% is coniferous and 23% is broadleaved (Table 4). Figure 7 shows that the trees growing in British Columbia are very large: they make up 36% of the forest volume in Canada, despite growing on only 19% of Canada's forest area. Almost 94% of British Columbia's wood volume is coniferous. Ontario and Quebec have the next highest total volumes, along with the highest percentage of broadleaved volume, at 37% and 31% respectively.

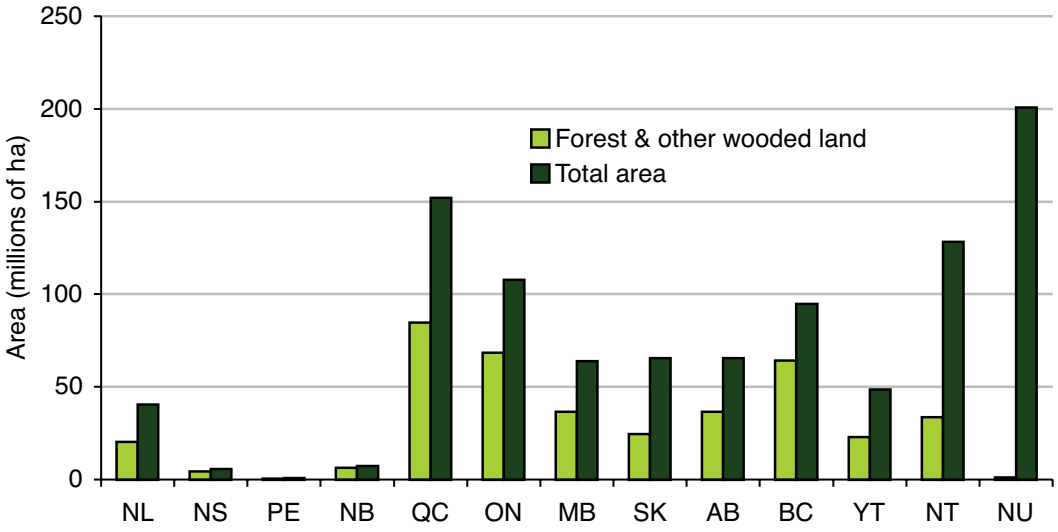

Figure 6. Total area and forest and other wooded land area by province/territory

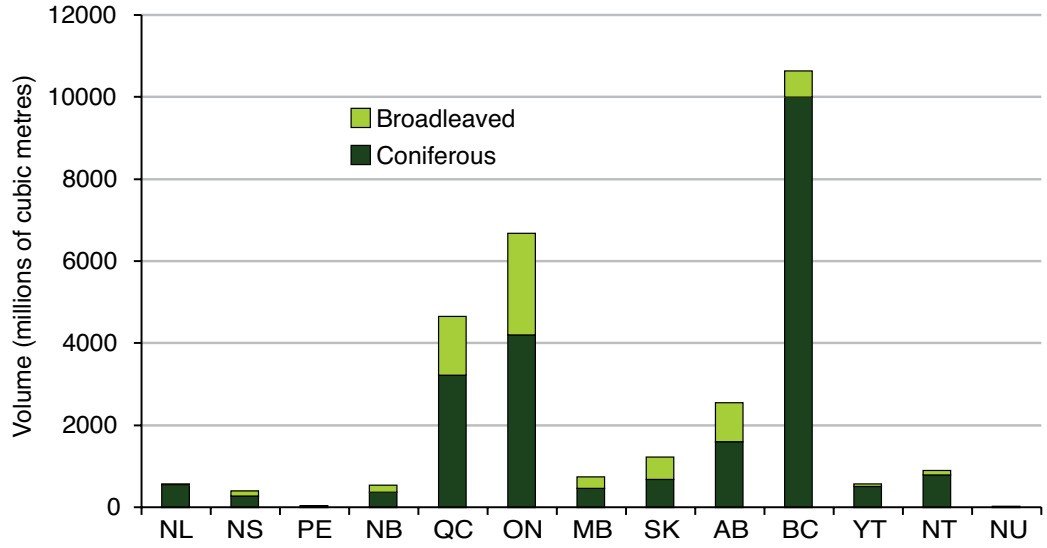

Figure 7. Total volume by coniferous and broadleaved classes, and by province/territory.

3.1 Land Class

Land class is a description of land cover, as recorded in source inventories from various observation platforms. Since the 1991 inventory was completed, CanFI2001 has expanded the number of land classes from 7 to 62. This expansion reflects a cultural change from wanting to know how much timber is available to a need for more all-encompassing knowledge of the land and what is on it.

Figure 8 shows distribution of land classes across Canada. In the farming regions of southern Ontario, the prairies, and Alberta's Peace River region, the dominant land class is agriculture. The main forested area of Canada—shown by the dark green band—extends from Newfoundland through to the western Northwest Territories. The high mountainous regions of British Columbia and the Yukon are naturally non-vegetated. Northwest Territories, Nunavut and the northern regions of Labrador, Quebec, Ontario and Manitoba are classed as vegetated non-treed. For the few areas for which information is missing, the data sources were unable to determine land cover: for example, if land was obscured by cloud, the classification of satellite imagery would not have been able to distinguish a land class.

Figure 9 shows percentage of vegetated land for each CanFI2001 mapping unit. Only about 13% of the country is less than 20% vegetated. Most of these areas occur in Canada's far north, in the mountains of British Columbia and the Yukon, in northern Saskatchewan and Manitoba, and into the Northwest Territories and Nunavut.

The extent and amount of forest and other wooded land are shown in Figure 10. Forest and other wooded land do not occur in Canada's north (Nunavut, Northwest Territories, and northern Quebec and Labrador) nor in the agricultural areas of the prairie provinces and southern Ontario. Figure 11 shows the extent and amount of forest land.

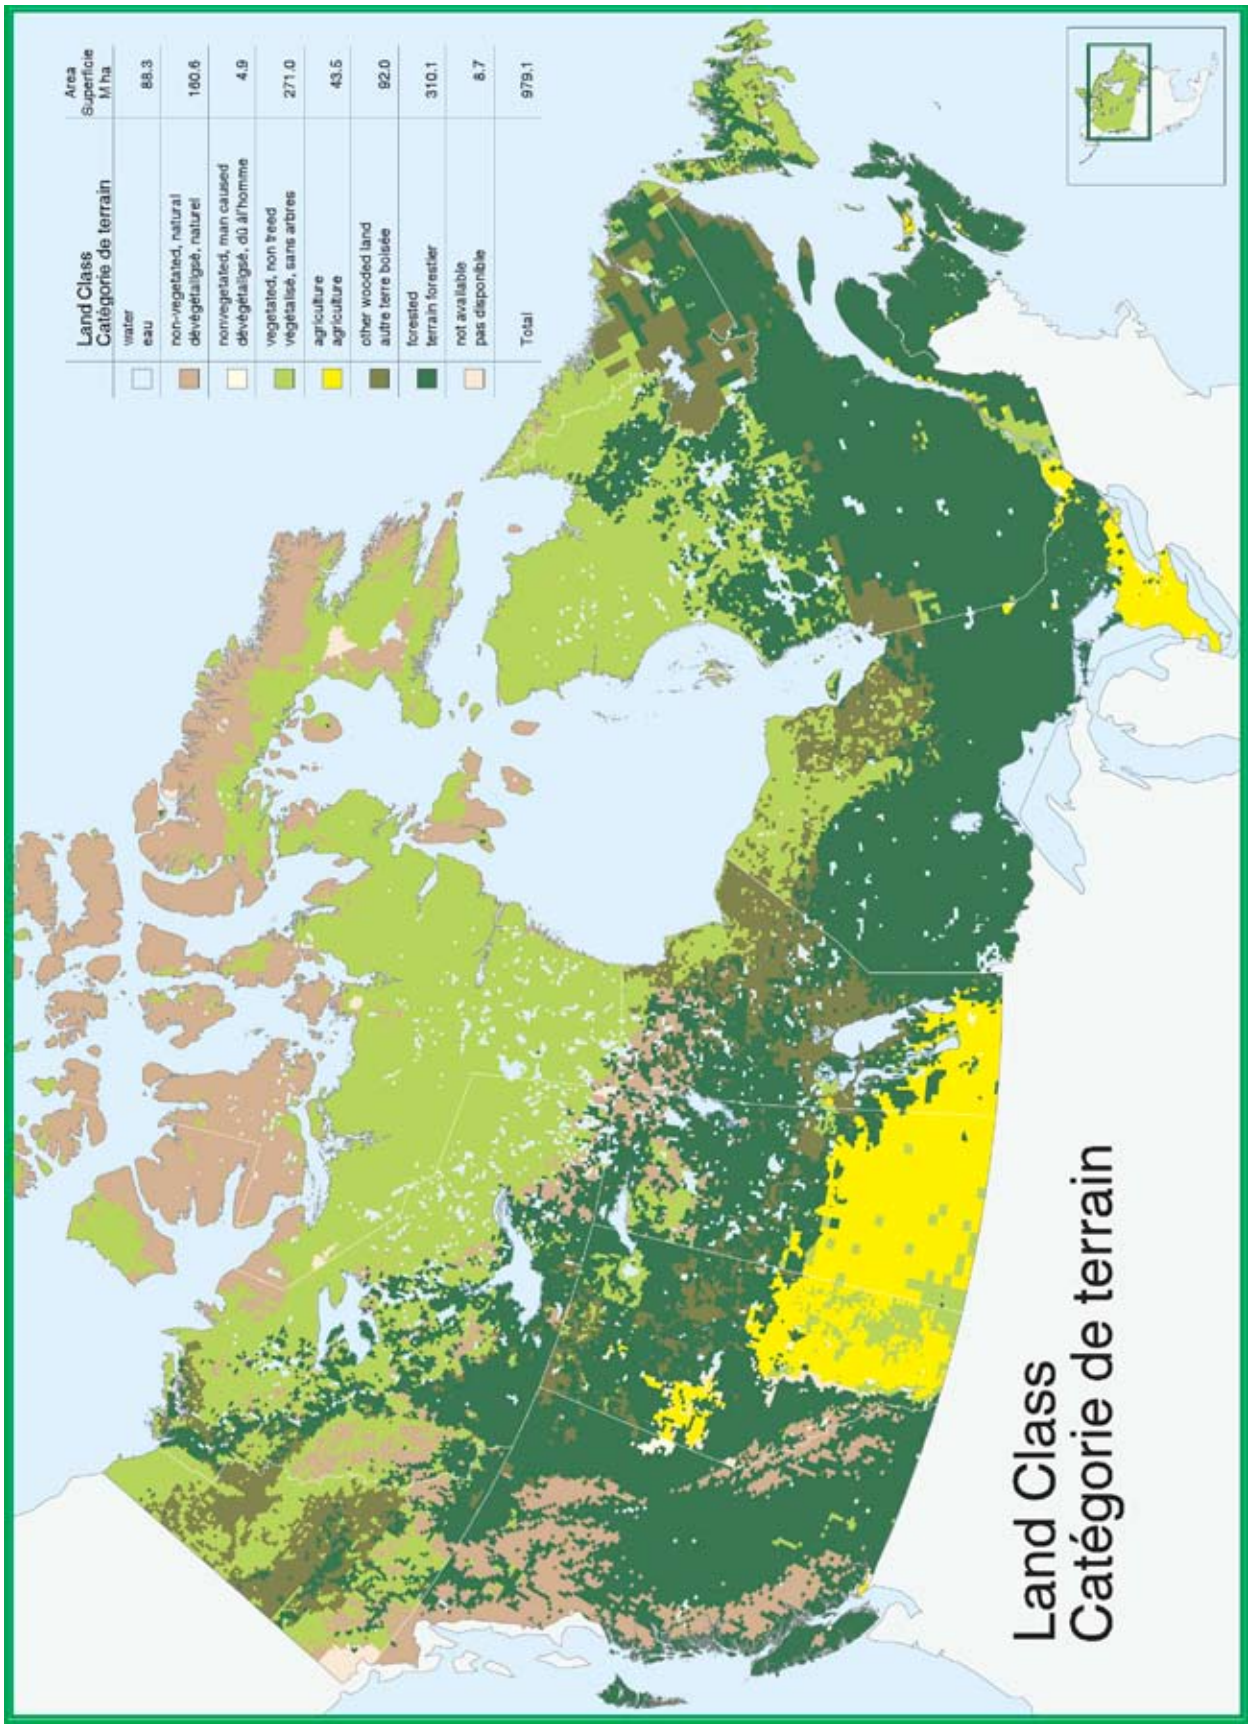

Figure 8. Distribution of land classes in Canada

Figure 9. Vegetated land.

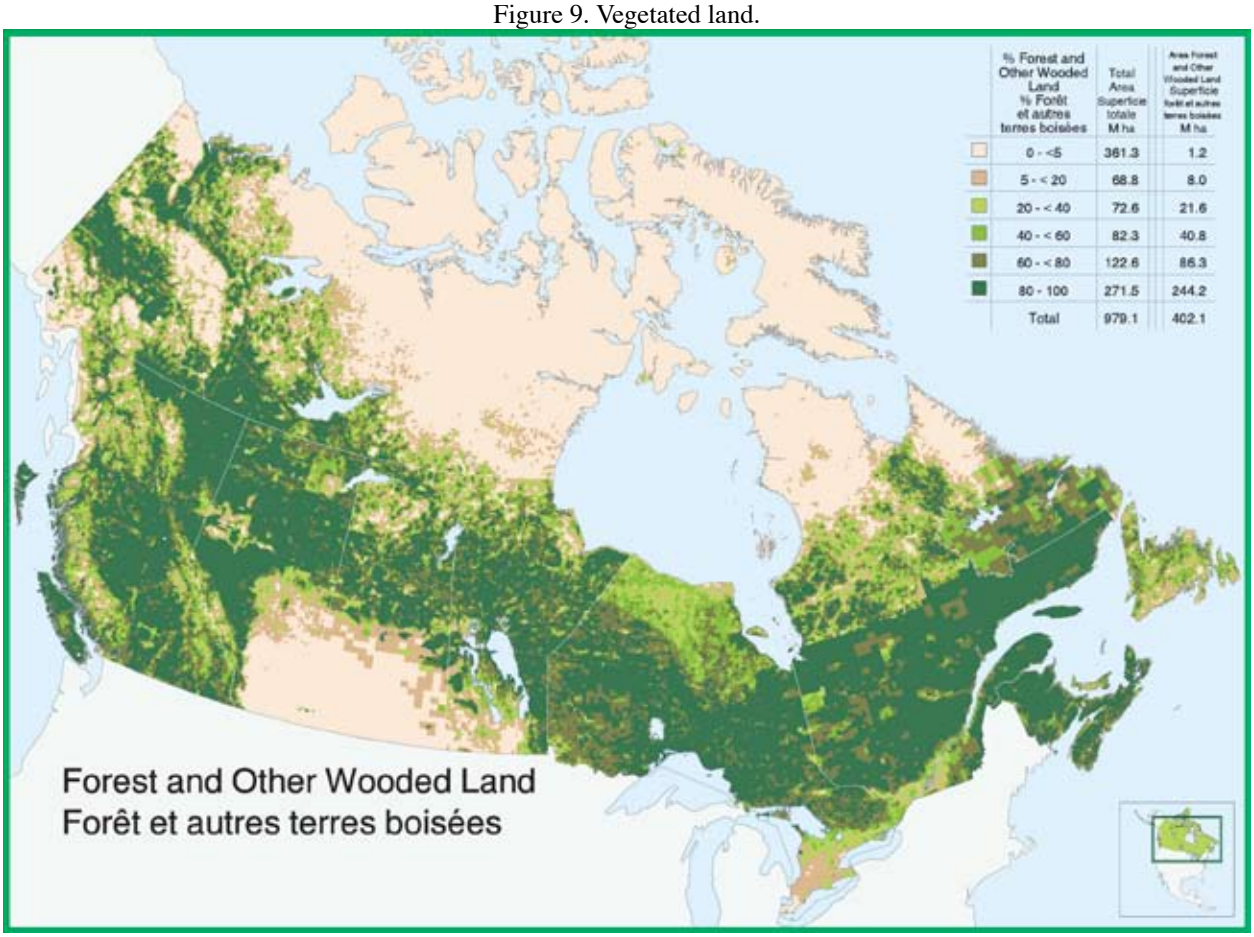

Figure 10. Forest and other wooded land

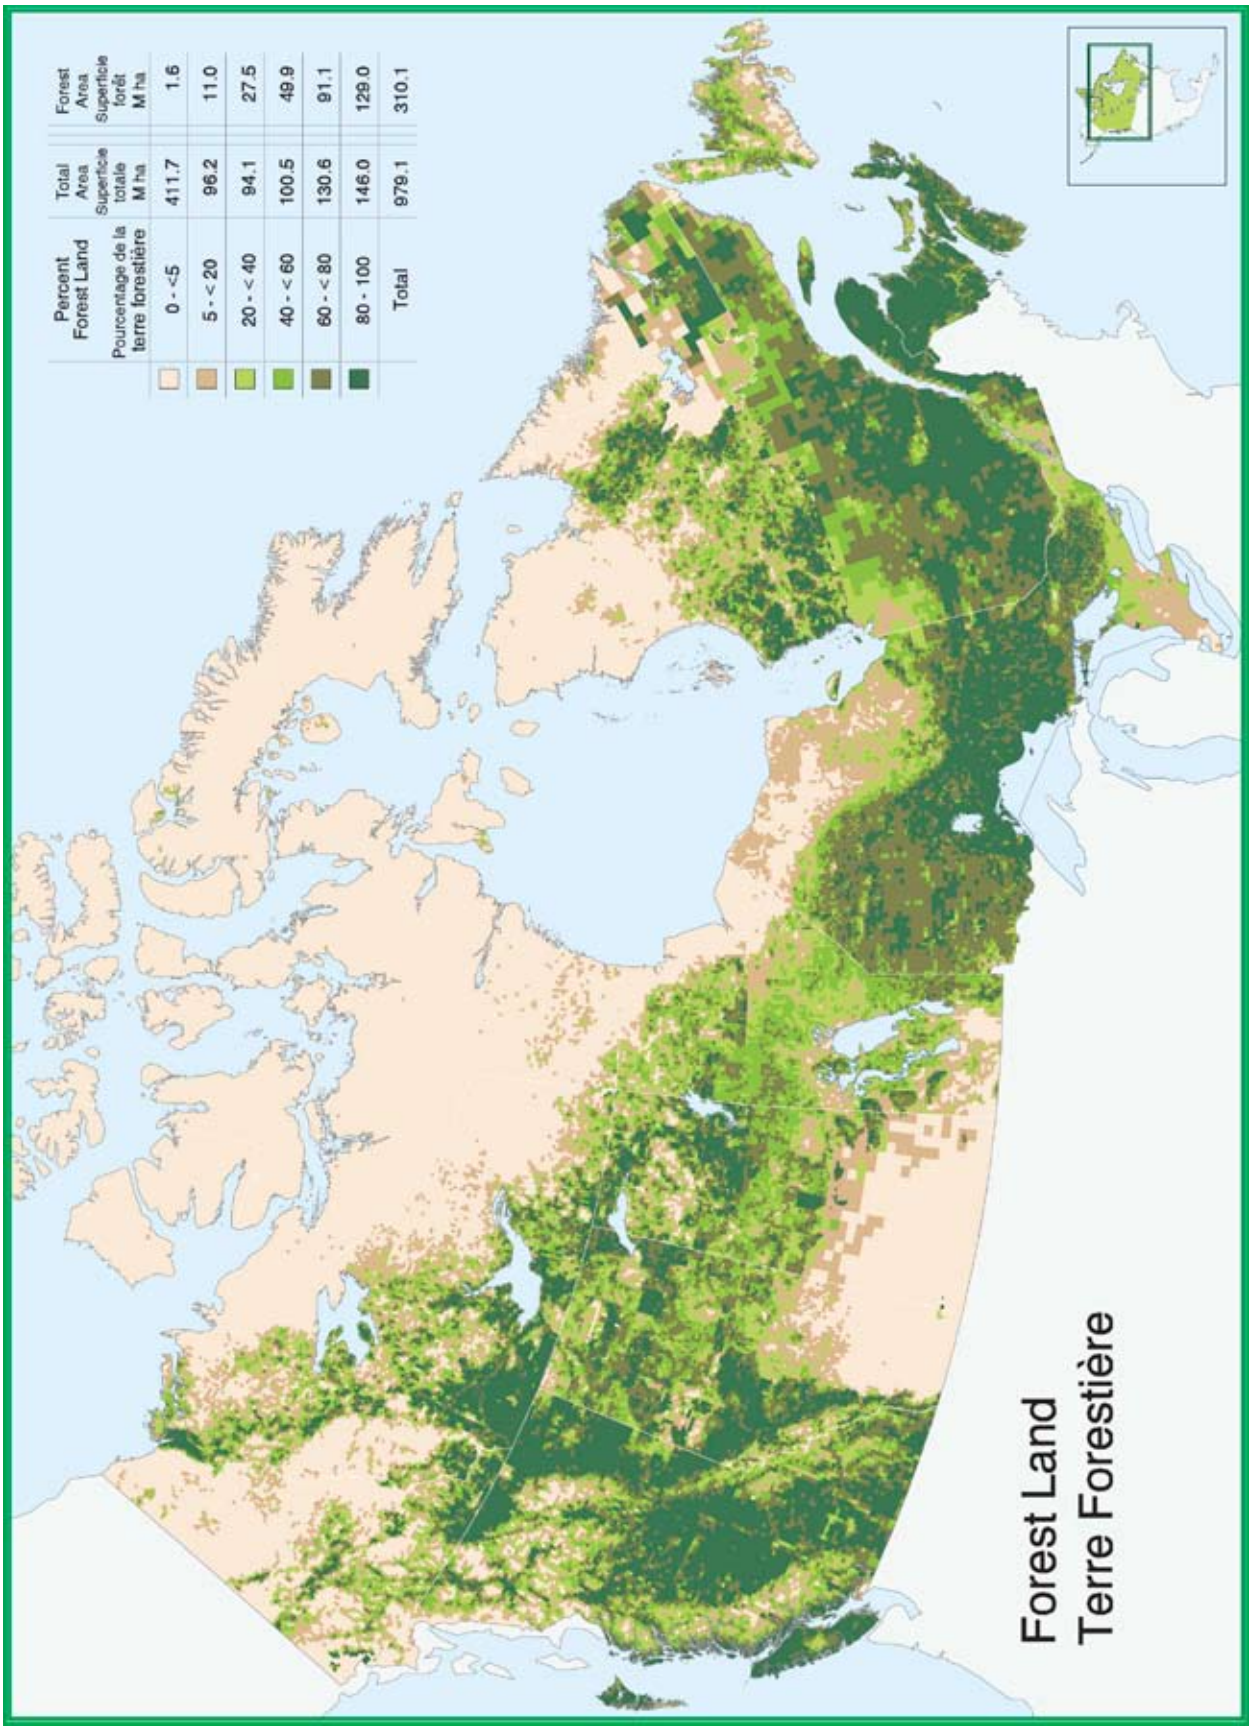

Figure 11. Forest land

Table 5 lists the area for each of the non-vegetated land classes (defined in Appendix II) occurring in CanFI2001. Table 6 lists the area, total volume and biomass for the vegetated land classes. Table 7 summarizes area by land-class groups and province and territory. Forest land covers most of Canada, with naturally vegetated non-treed land cover being the second most abundant land classification. Fresh water features cover 9% of Canada. Less than 1% of the country lacks information regarding land cover, mostly because the data sources for these areas included satellite imagery with land-obscuring cloud.

3.2 Ownership

The owner of a forest is responsible for its management. In CanFI2001, ownership of all lands is divided into federal crown land (including national parks, Department of National Defence land and the three territories), provincial crown land, First Nations land (Indian reserves), municipal lands, and private land. The private land has been classified, where information was provided, into industrial land (owned by a large corporate industry for commercial forestry purposes) and non-industrial land (owned by corporations or individuals that may or may not be used for commercial forestry purposes).

For all of Canada, about 91% of the total area is owned by the Crown (including First Nations land), with the rest being private (Figure 12). Large forest industry companies own 5% of privately owned land in Canada; the majority of private land (62%) is owned by nonindustrial owners, and the rest (33%) is owned with no indication of whether the owners are industrial or nonindustrial.

Area of forest and other wooded land is listed by ownership category in Table 8. Figure 13 shows the relative percent of ownership class for each province and territory. Prince Edward Island, Nova Scotia and New Brunswick have more private land than crown land; this situation is reversed in the other provinces. All forest and other wooded land in the territories is owned by the federal Crown. Across Canada, forest and other wooded land is about 93% publicly owned. This contrasts with the situation in the United States and many western European countries, where most forest and other wooded land is privately owned (United States, 58%; Austria, 80%; France, 76%; Norway, 83%; FAO 2006). Ownership of forest land by province and territory is listed in Appendix I: Table I-3.

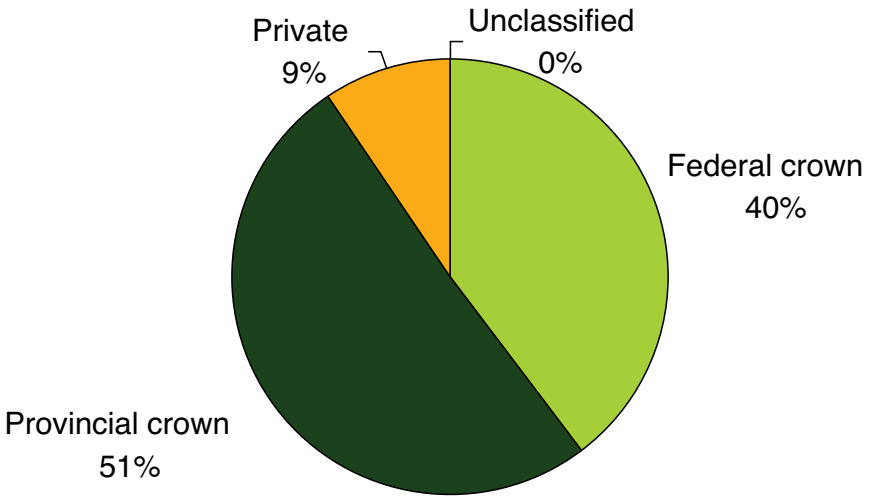

Figure 12. Total area by ownership class.

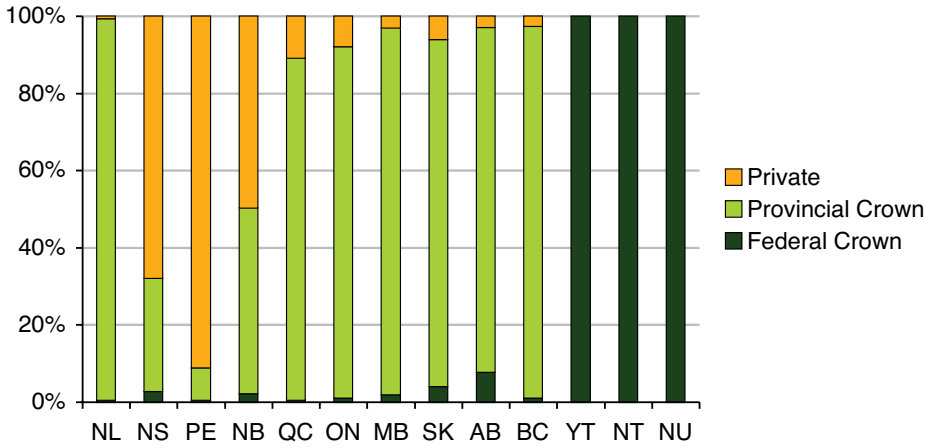

Figure 13. Percentage of ownership class of forest and other wooded land by province and territory

3.3 Status

Status refers to the status of land with respect to timber harvesting. Land may be reserved from timber harvesting by law (e.g., within a national park), management of the land may be retained by the owner (e.g., harvest allocation through quota or licences), or it may be delegated to another agency (assigned; e.g., via forest management agreements).

Table 9 lists the area of forest and other wooded land by status and province and territory; Table 10 lists the area of forest by the same classes. Five percent of the area of forest and other wooded land in Canada is reserved from forest harvesting (Figure 14). Figure 15 shows that the percentage of reserved forest land in Alberta is highest among the provinces and territories at about 12%, whereas Prince Edward Island has the lowest percent of reserved forest land (other than Nunavut)—this is mainly because it has such a high proportion of private forest (Appendix I: Table I-3).

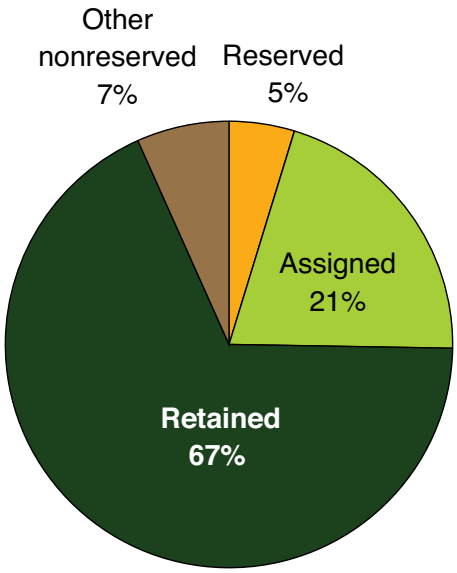

Figure 14. Area of forest and other wooded land by status class in Canada.

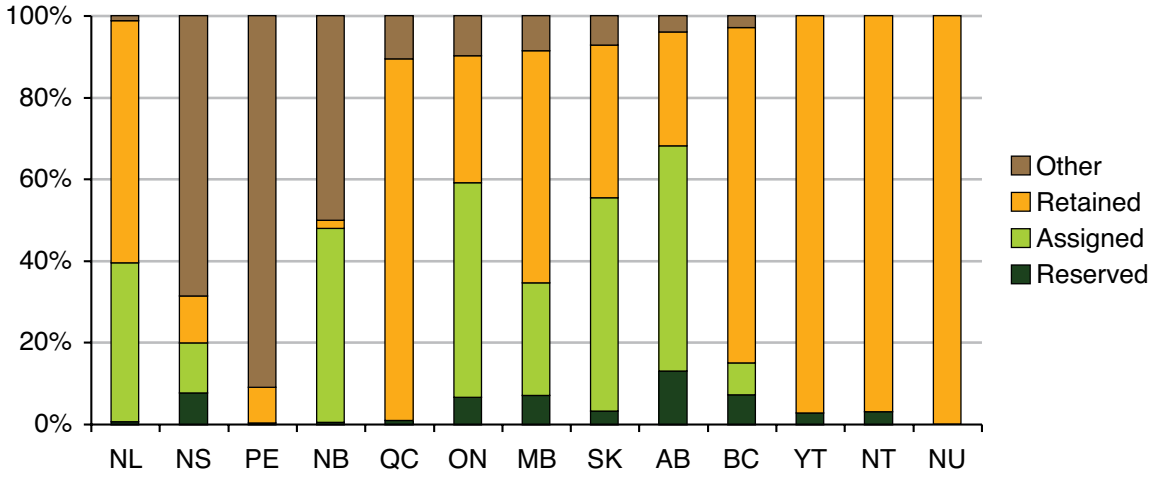

Figure 15. Relative proportion of forest land by status class in each province and territory.

3.4 Site Index

The ability of a particular location to grow trees depends on many factors, including soil nutrients and texture, drainage and climate. Because soil and climate factors are not easily measured or estimated from aerial photography, whereas tree height and age are, forest inventories use tree height at a certain age to predict future performance. CanFI2001 uses an index age of 50 years (100 years in the Yukon).

Site index is not available for all data sources in CanFI2001; of the 310 million ha of forest land in Canada, 38% (just under 120 million ha) has no site index information. Where information is available, Canada's forests have an average site index of 11.8 m at age 50 (Table 11; Appendix I: Table I-4). Volume per hectare and biomass per hectare tend to increase as site quality increases (Figure 16; Appendix I: tables I-5 and I-6).

The forests with higher site indices (27.5 m or taller at 50 years) are not extensive, they amount to about 1 142 000 ha (Figure 17; Table 11). The higher site-index forests contain 369.5 million m^3 of 29 383 million m^3, or 1.3% of the total volume (Table 11; Figure 18). Similarly, just 1.6% of the biomass is found in forests of higher site indices. Appendix I: tables I-7 and I-8 show total volume and biomass by site index and province and territory.

Figure 19 shows the predominant site index, based on the site index with the greatest area within a mapping unit. The highest site indices are found on the west coast, and a few higher site index areas exist in Ontario and New Brunswick. Most forests in Canada reach between 5.0 m and 19.9 m at 50 years.

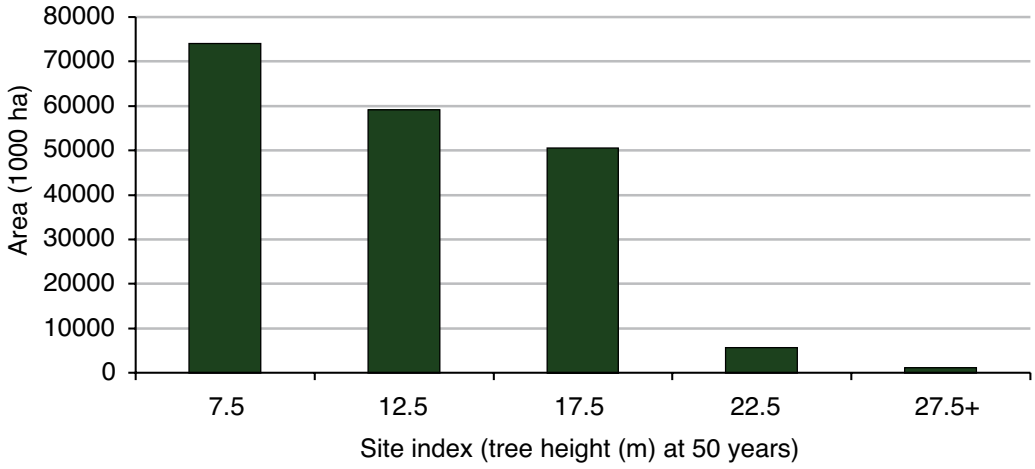

Figure 17. Area of forest land by site index class.

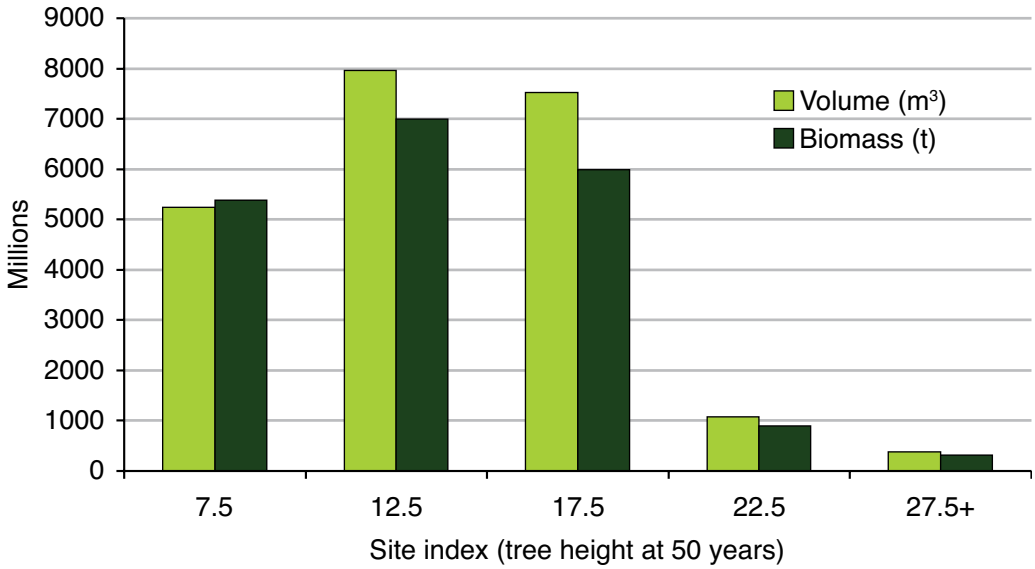

Figure 18. Total volume and total biomass by site index class.

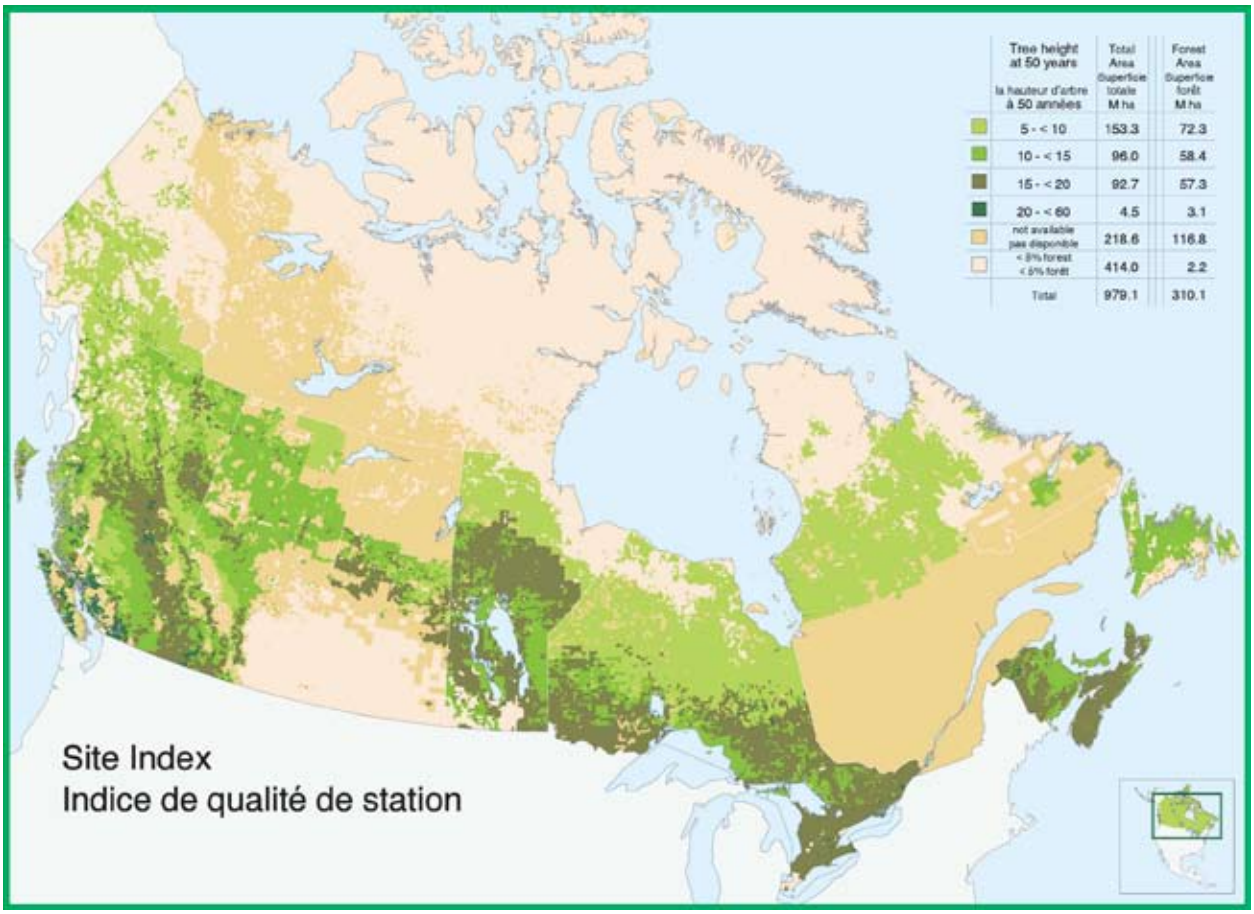

Figure 19. Site Index

3.5 Stocking

Stocking describes the density of forest stands. Nonstocked (2% of Canada's forest land) refers to forest land known to have few trees, or where the density is below the threshold that defines stocked. The stocking unknown class (10% of forest land) refers to areas recently subject to forest disturbances such as fire, harvesting, windthrow, insect or disease damage, or may be abandoned farmland: the effects of the disturbance on the area's stocking status are yet undetermined. The remainder of forest land (88%) is classified as stocked (Figure 20).

Stocked forest (274.9 million ha) is further defined as regenerating (1%), partially stocked (37%), fully stocked (58%), and stocked with extent not known (4%). Seventy-nine percent of the volume, or 23 264 million m^3, exists on 160.8 million ha of fully stocked forest (see Table 12). Figure 21 shows the percent of forest land that is stocked, including the classes stocked, partially stocked and fully stocked; Figure 22 shows the area of forest land where stocking is unknown, according to disturbance class.

Appendix I: Table I-9 shows the area of forest land (in thousands of hectares) by stocking class and province and territory.

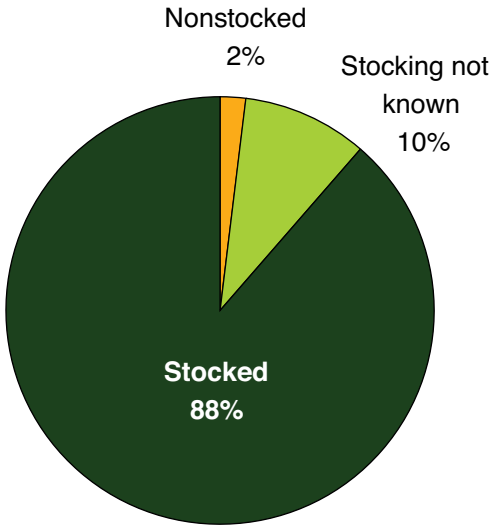

Figure 20. Area of forest land by grouped stocking class

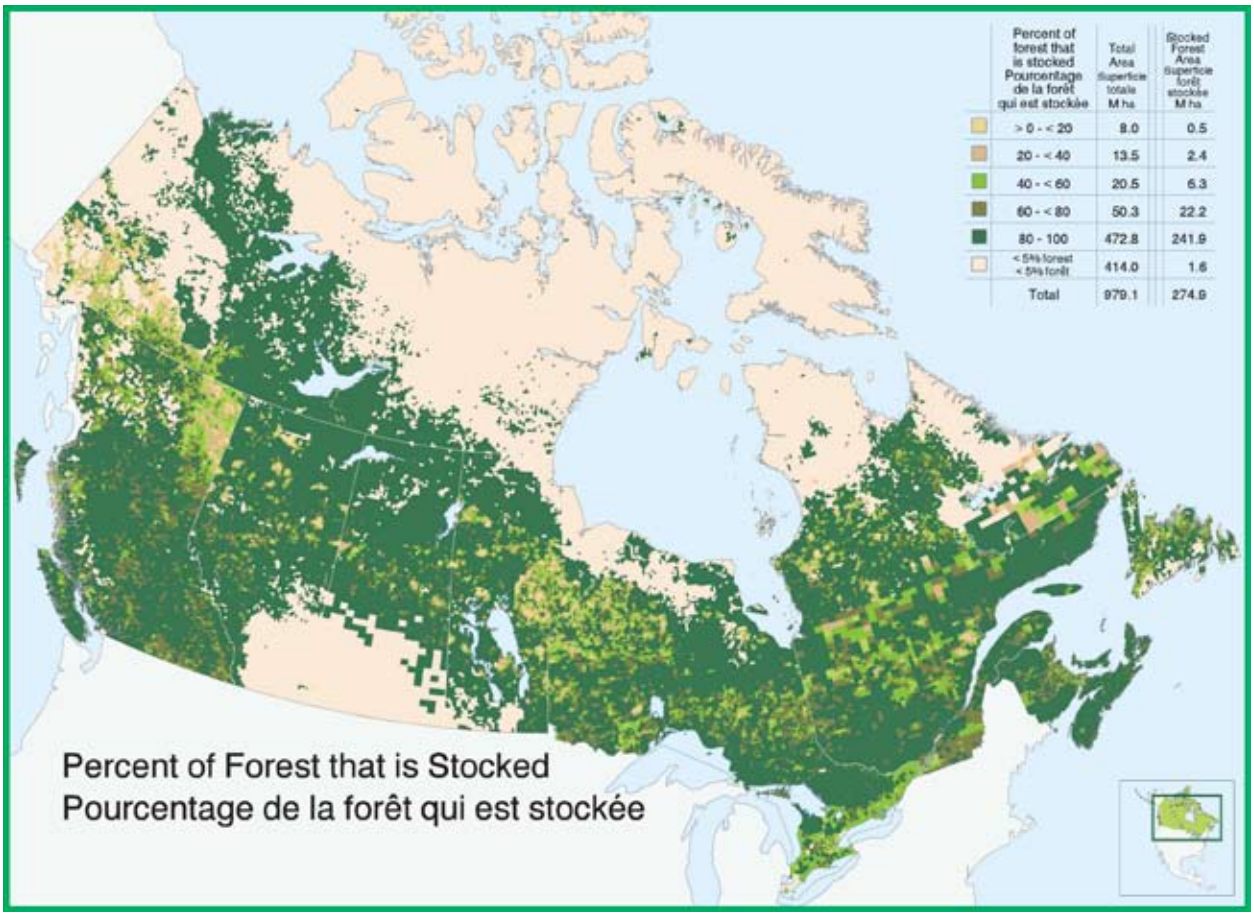

Figure 21. Percent of forest that is stocked

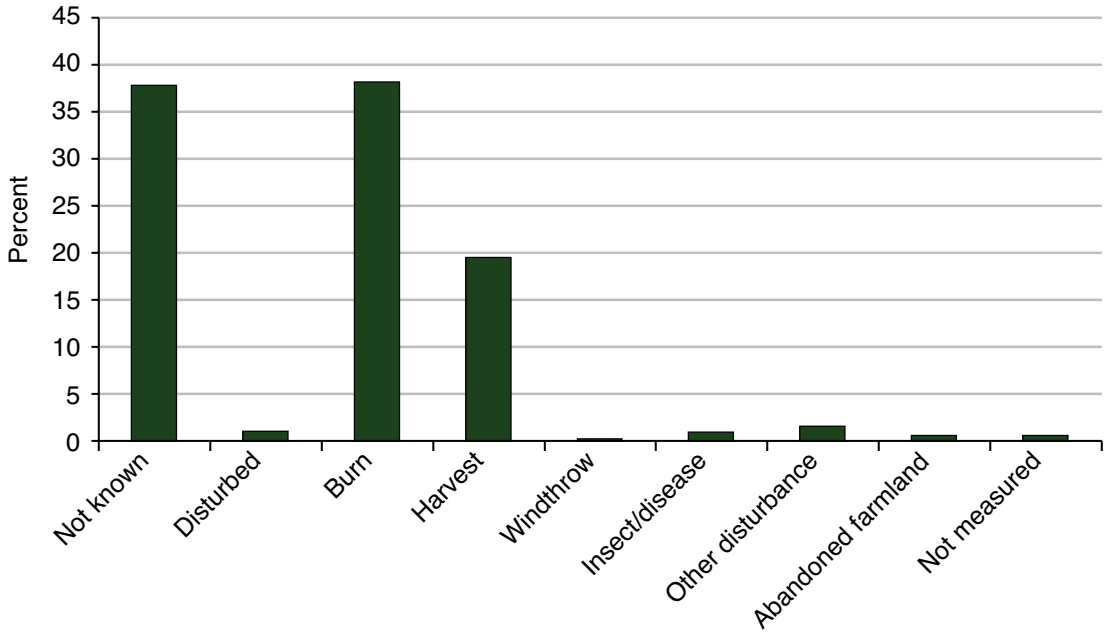

Figure 22. Percentage of area where stocking is not known, by disturbance class

3.6 Age and Maturity

Knowing the ages of forests is important for the management of Canada's almost exclusively even-aged forests. Age can be difficult to determine from air photos and almost impossible to estimate from satellite imagery; about 37% of the stocked forest lacks age information. This is represented in Figure 23 (the "not available" class). The map also shows that the highest age classes are in British Columbia, where long-lived species such as Douglas-fir and western redcedar occur.

Where age information is available, the majority of the stocked forest (78%) is as old as 120 years, with 22% being older than 120 years (Figure 24). Average volume and biomass increase with age, but the rates of increase slow with age (Figure 25). Total volume of the stocked forest up to 120 years old makes up 63% of the total volume where age information is known; 37% of the total volume of known-age forest is from trees older than 120 years (Figure 24). Total biomass of the stocked forest where age is known is similar, with 64% being from trees as old as 120 years, and 36% from trees older than 120 years. Appendix I: tables I-10 to I-14 detail area, volume and biomass according to age class and province.

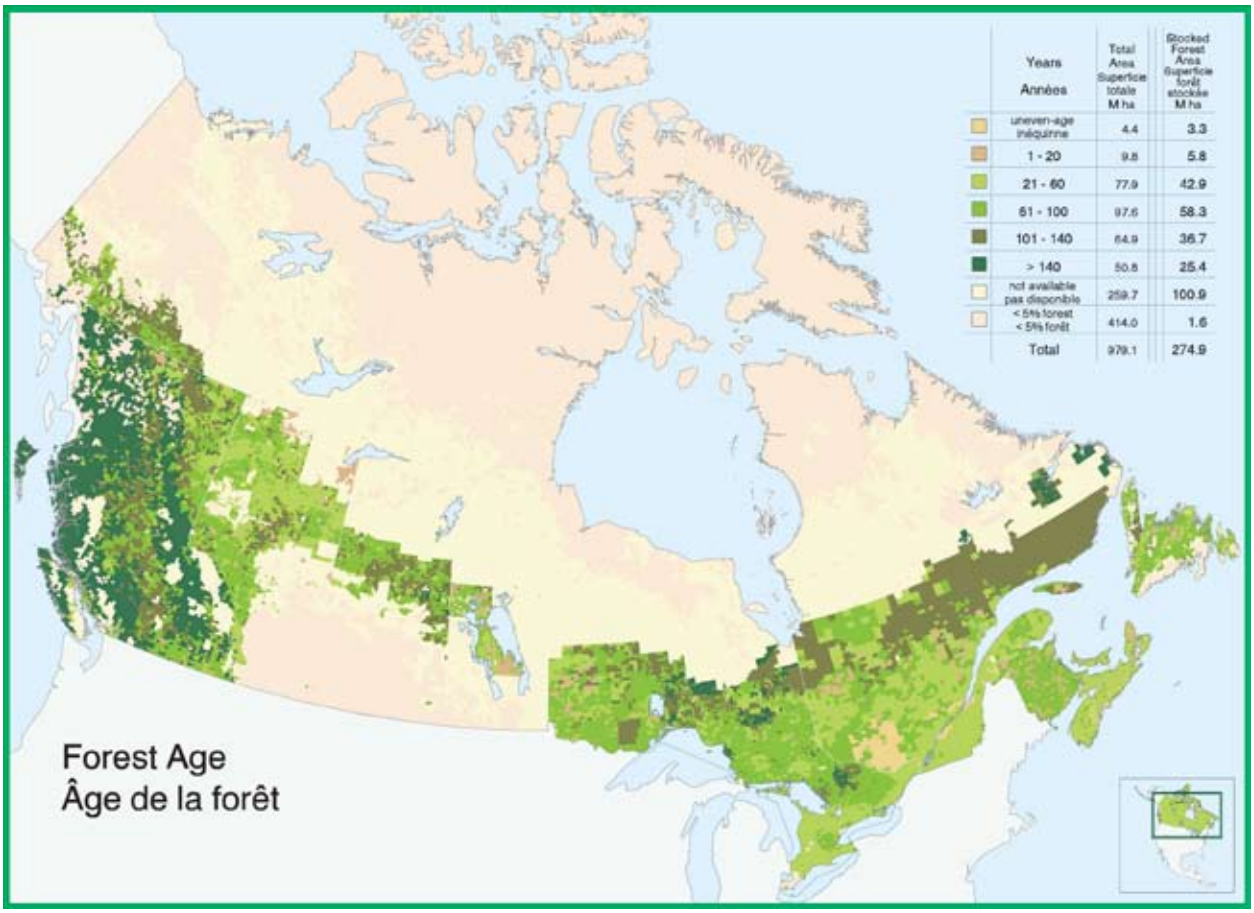

Figure 23. Forest Age

Age is an objective description of the forest condition, whereas maturity is measured against the expected life expectancy of a tree species. For example, black spruce is a long-lived species, and can live 300 years; trembling aspen, however, typically becomes over-mature at about 80 years. Most forests in Canada are even aged, as many species regenerate at the same time following a fire or harvest; only a small percentage are uneven aged. As with age information, maturity information is not available for all of Canada's forests (Figure 26), because it is not possible to determine maturity of forests from data sources such as satellite imagery. The stocked forest with maturity information available represents 70% of the total stocked forest, and accounts for 88% of the total volume.

The most volume and biomass occurs, as expected, in mature forests, which account for 44% of the stocked forest area, 58% of the total volume, and 55% of the total biomass. Immature forests account for 36% of the area, 28% of the volume, and 31% of the biomass. Figures 27 and 28 summarize percent of total area, volume and biomass by maturity class; Appendix I: tables I-15 to I-19 detail area, volume and biomass by maturity class for each province and territory.

Figure 26 maps predominant maturity class by area. Most of Canada's forests are either immature or mature. Most tree species in British Columbia, although old, are not considered over-mature from the forest management perspective, as they are long-lived species.

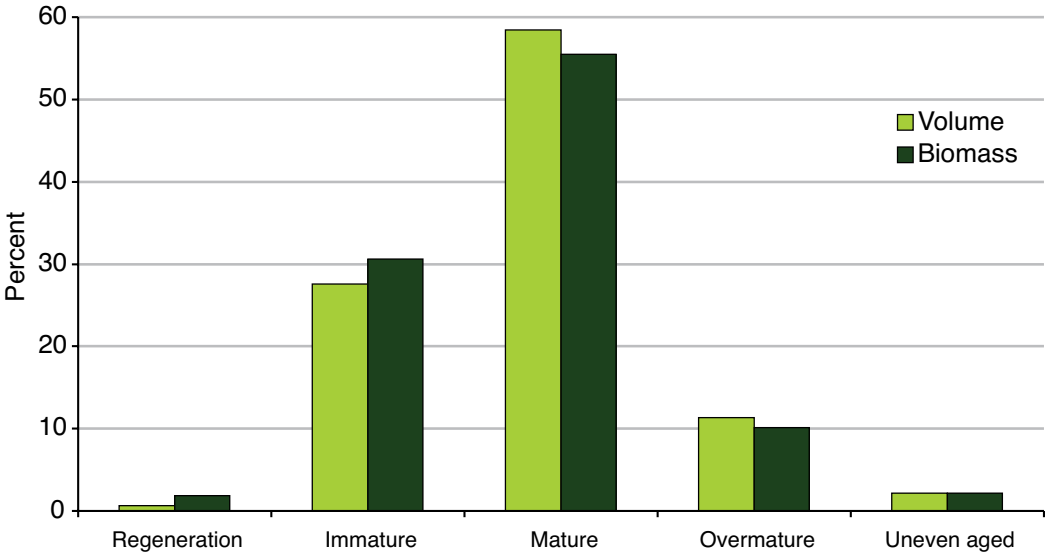

Figure 28. Percents of total volume and biomass on stocked forest land by maturity class.

3.7 Forest type

Canada's forests are described in CanFI2001 by percentage canopy cover of coniferous and broadleaved species within a forest stand. A stand is considered softwood when 76% to 100% of the canopy consists of coniferous species, mixedwood when 26% to 75% of the canopy consists of coniferous species, and hardwood when 0% to 25% of the canopy consists of coniferous species. The proportions are similar when area and volume are considered: 65% of the stocked forest land area is classed as softwood, 22% as mixedwood, and 12% as hardwood; 69% of the total volume and 68% of the total biomass are contained within the softwood forest type, 18% of the volume and 19% of the biomass are within mixedwood , and 13% of both volume and biomass are within hardwood (see Table 13 for total areas, total and average volumes, and total and average biomasses). Appendix I: tables I-20 to I-24 list area, volume and biomass on stocked forest land by forest type and province and territory.

Figure 29 maps predominant forest types for all of Canada. Hardwoods are common in the southern extent of the forest lands of Quebec through to Alberta and into northeastern British Columbia; softwoods dominate the east and west coasts. From the hardwood forest zone, there is a northward progression through predominantly mixedwoods to almost entirely softwoods. In the forested zone's northern reaches, mixedwood forest becomes dominant again, particularly in northern Saskatchewan and the Northwest Territories.

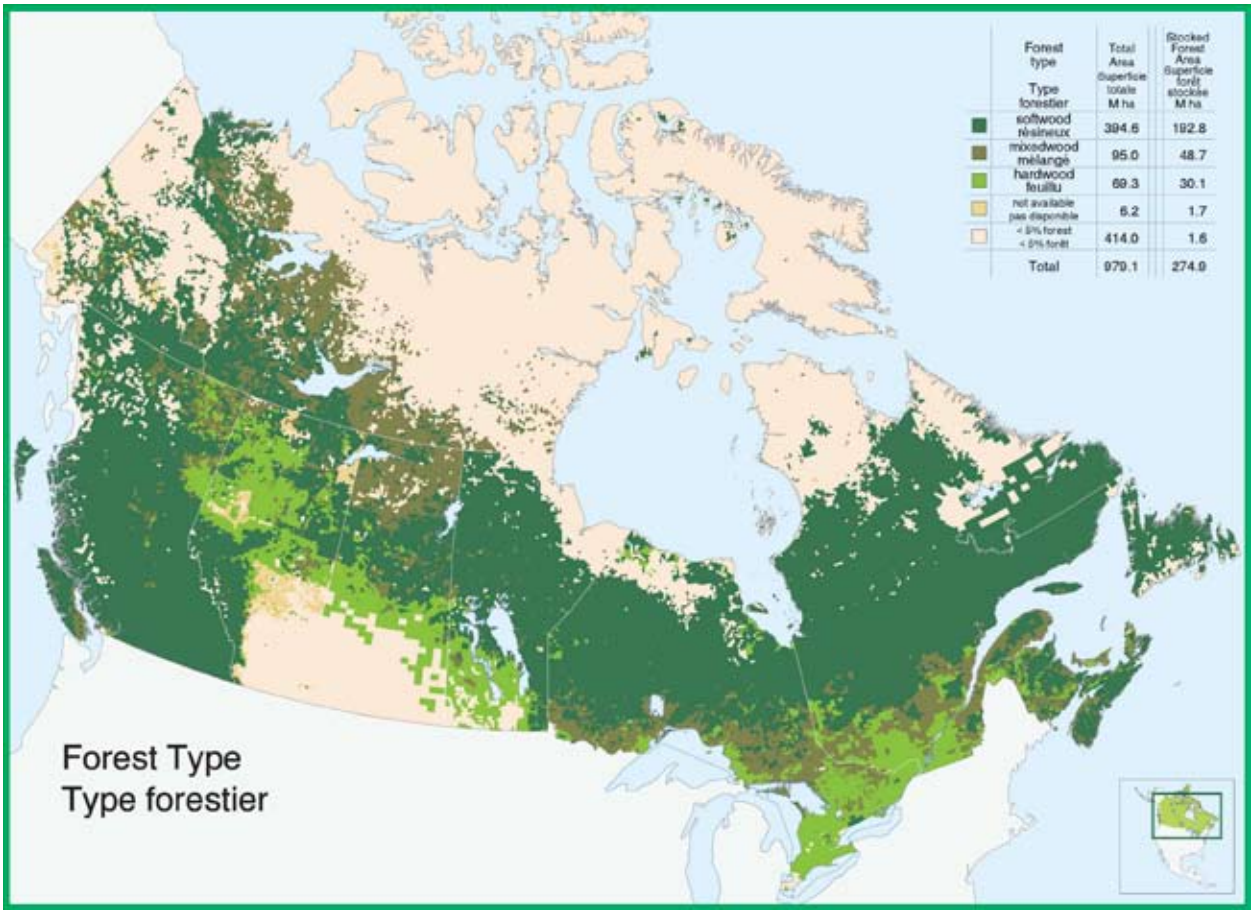

Figure 29. Forest Type

3.8 Predominant Genera

Canada's stocked forests are further described according to predominant genera indicated in source inventories' stand descriptions. Depending on relative abundances of species in a stand, the predominant genus is not necessarily the genus of the first species listed. For example, the species description for a stand may indicate that white birch covers 40% of the area, black spruce 35%, and red spruce 25%. This stand would be classified as having a predominant genus of spruce (60% of the stand) rather than birch (40%).

Because data sources—specifically satellite imagery—for many areas cannot distinguish species, only whether a stand is coniferous or deciduous, the most abundant predominant genus class description in Canada is recorded as unspecified coniferous species (Figure 30). The reason that unspecified broadleaved species are not as prevalent as unspecified conifers is that satellite imagery is, for the most part, used in the remote northern regions of the country, where forests are either entirely coniferous or dominated by conifers. As seen in Figure 31, unspecified conifers do not make up the majority of volume, because volumes in the northern regions are small compared to the rest of the country (see Figure 37, Coniferous volume).

In area, volume and biomass, the three most prevalent specified predominant genus values are spruce, pine and poplar. Appendix I: tables I-25 to I-27 detail area, total volume and total biomass by predominant genus and province and territory.

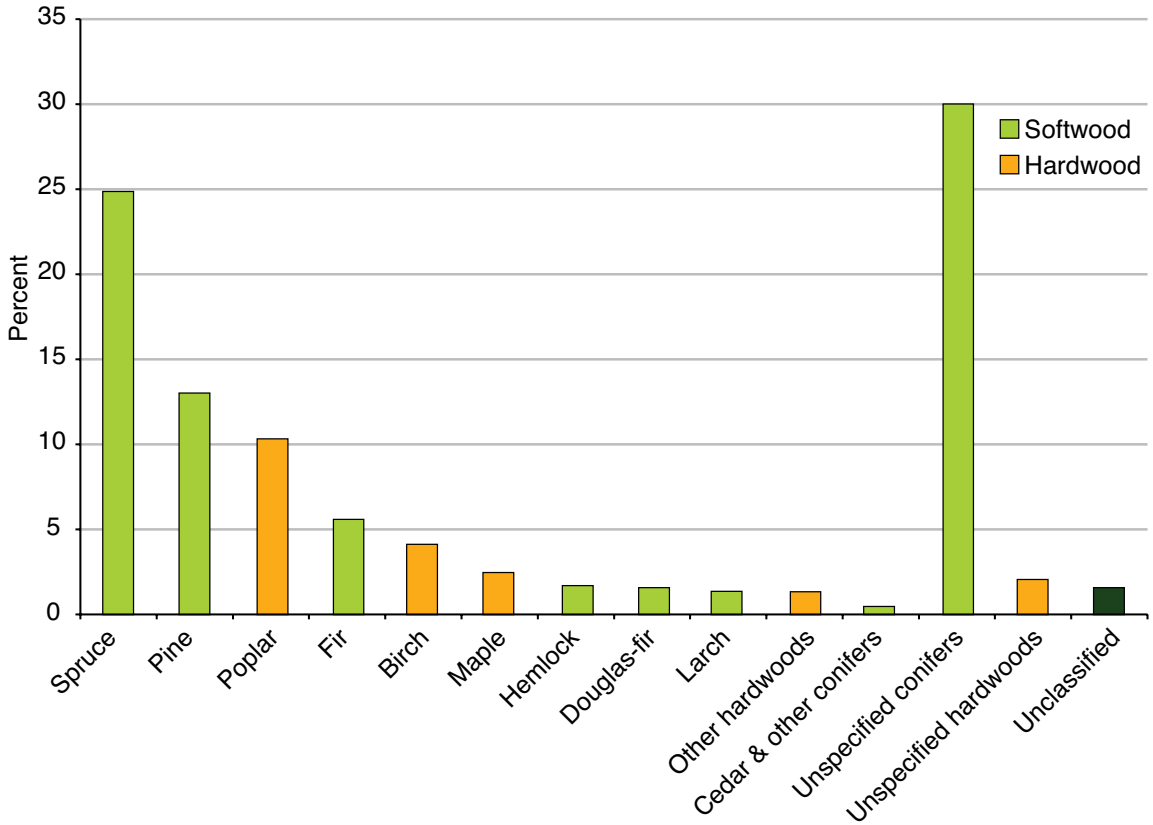

Figure 30. Area percent of stocked forest by predominant genus in the canopy.

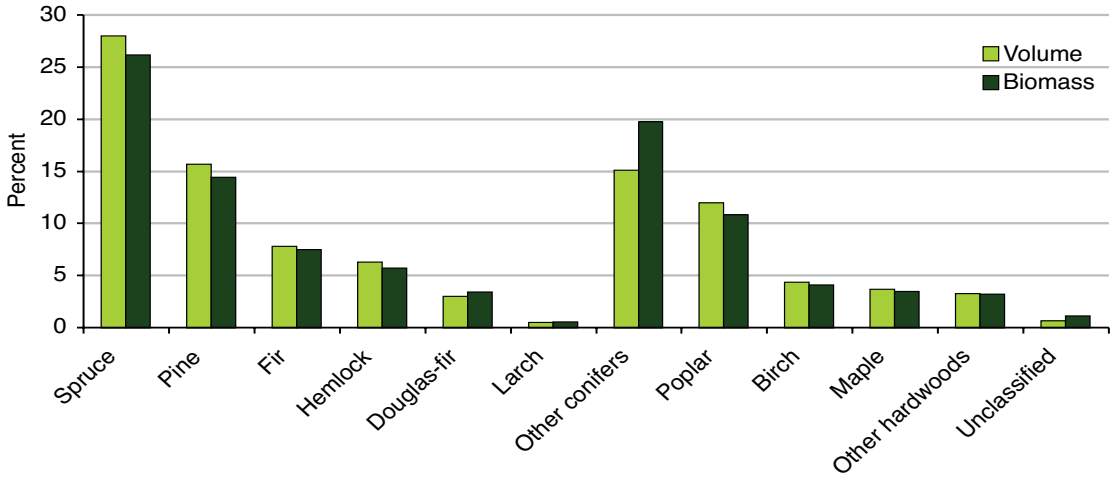

Figure 31. Total volume and biomass percents on stocked forest by predominant genus in the canopy

3.9 Lead species

Canada's forests can also be described according to lead species, the first species listed in forest stand descriptions. Examination of area covered by the leading species grouped at the genus level yields results similar to the predominant genus area results. Figure 32 shows the area percent of stocked forest by grouped leading species; compared to Figure 30, there is little difference: the percentage of unspecified conifers is slightly less and the percentages of spruces and of firs are higher.

Figure 33 shows relative percentage of forest type for each grouped lead species: where the leading species are spruce, 90% of the stands are softwood forest type; where the leading species are birches, about 38% of the stands are hardwood stands, about 60% are mixedwood stands, and 2% are softwood stands. As expected, coniferous species are lead species in mostly softwood forest types, and broadleaved species lead in a much higher proportion of mixedwood forest types than coniferous species do. Table 14 shows area of stocked forest by grouped leading species and forest type. Appendix I: Table I-28 lists area for each of the leading species by forest type. Appendix I: Table I-29 provides coniferous, broadleaved, and total volume summaries for records with the listed leading species.

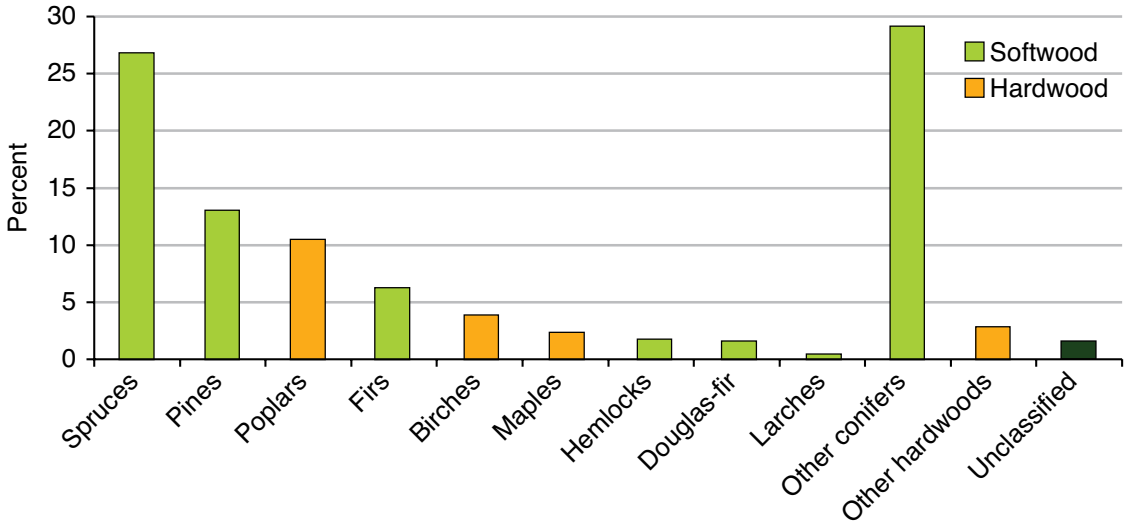

Figure 32. Area percent of stocked forest land by lead species.

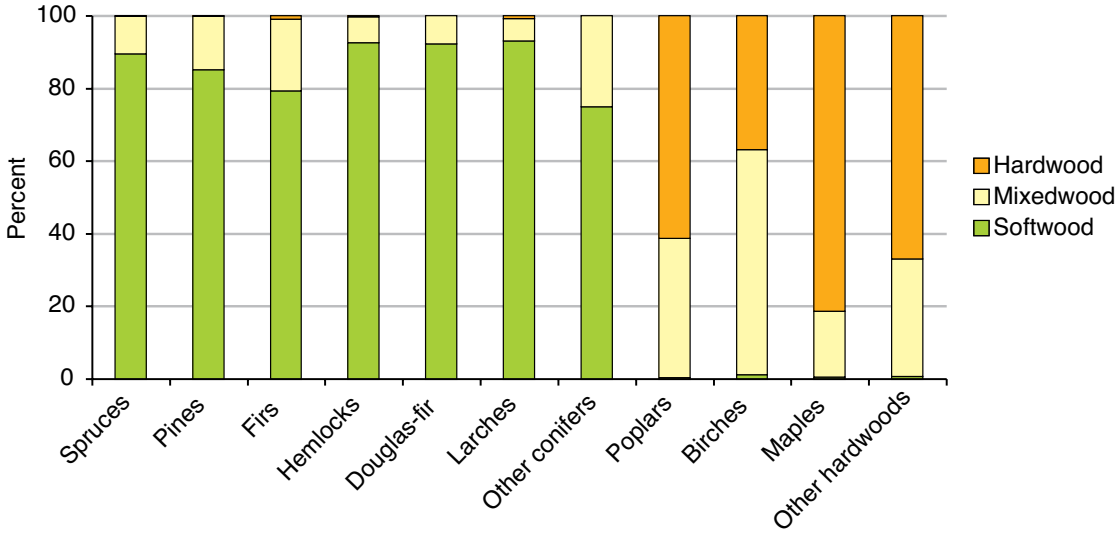

Figure 33. Area percentage of forest types for each grouped lead species in the canopy.

3.10 Volume

Volume information in CanFI2001 is generally derived from volume tables developed from field samples for provincial forest management inventories. It is stored as cubic metres per hectare for each of 87 species. The number of species is so large because different species grow in different parts of Canada, and because source inventories vary in the detail to which their volume tables were created: some include what might be considered minor species, and some group species (e.g., maple, instead of red maple or sugar maple). In order to maintain as much detail as possible, CanFI2001 does not aggregate species to the lowest common denominator.

Table 15 lists volumes for species, grouped for the purpose of this report, in cubic metres, rather than in the millions of cubic metres usually used, in order to show contributions of minor species to the total. Spruces make up more than one-third (10 billion m^3) of the more than 29 billion m^3 of total wood volume in Canada. Pines and the poplar/aspen group contribute 5 billion m^3 and 4 billion m^3, respectively. Figure 34 shows percentage by volume of grouped species. Unlike Figure 32, which shows percentage based on area and species is the one listed first in a forest stand description, Figure 34 is based on volume tables. Because volume tables are developed from field samples, volumes are rarely calculated for unspecified conifers: thus, Figure 34 does not list unspecified conifers as the highest percentage.

Figure 35 maps genera with the most volume in each mapping unit. A mapping unit may have the most volume represented by firs, but the majority of the total volume in the mapping unit may be represented by broadleaved genera. In Figure 35, this mapping unit would be classed as fir, whereas, when figures 37 and 38 are compared, the mapping unit may indicate more broadleaved volume than coniferous volume. The larch, cedar and other conifer species group is shown to be predominant in northern Quebec, because volume information from areas with similar characteristics was extrapolated to areas for which original data sources lacked volume information.

Figure 36 shows total wood volume in Canada. The highest volume is found in coastal British Columbia, with the rest of the province also having high volumes. Ontario is the province with the second highest volumes per mapping unit.

Figure 37 maps coniferous volume. British Columbia, Ontario, Quebec and Alberta have high concentrations of coniferous volumes. The map of broadleaved volume (Figure 38) indicates that southern Ontario, the southern edge of forest in Saskatchewan, and the region from central Alberta to northeastern British Columbia have higher concentrations of broadleaved volumes than other areas of the country.

3.11 Biomass

Biomass is estimated using the methods described in section 2.7, but more specifically, stem wood, stem bark, branch and foliage biomass, as well as an estimate of dead biomass, in tonnes per hectare are predicted for each record in the CanFI2001 volume tables. However, unlike volume values, biomass values are aggregated across tree species. Four biomass components and the estimate of dead biomass are stored for each record, regardless of how many species may be represented in that record. The estimated biomass reflects species diversity, as it is comprised of a weighted average that includes all the species listed, but retains only one value for each component. These biomass-volume tables, along with the look-up tables for vegetated areas with no volumes, are then merged with the CanFI2001 area tables, and inherit the classifiers stored there. From these, summary tables, maps, and figures can be produced: Figure 39, which shows the total living and dead biomass by province, and Figure 40, the map of average biomass, are examples.

Percentage distribution of live biomass among the four components, summarized for leading coniferous and broadleaved species, are shown in Figure 40, and details for grouped leading species are shown in Table 16; full details by individual leading species are provided in Appendix I: Table I-30. The proportion contributed by stemwood is nearly identical for coniferous and broadleaved species: the proportionally thicker bark and branches of broadleaved species contributes more to biomass than do those of coniferous species; however, foliage contributes almost twice as much to coniferous biomass than to broadleaved biomass.

The map of average biomass (Figure 41) shows biomass derived from the forest inventory only: no estimation of biomass associated with agricultural crops on the prairies and in southern Ontario is included.

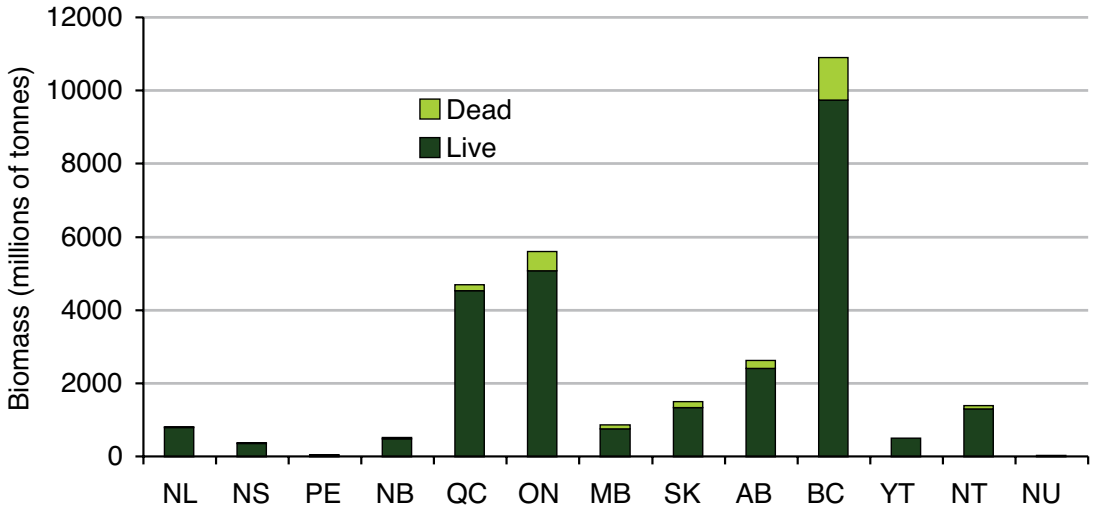

Figure 39. Total biomass of living and dead matter by province and territory.

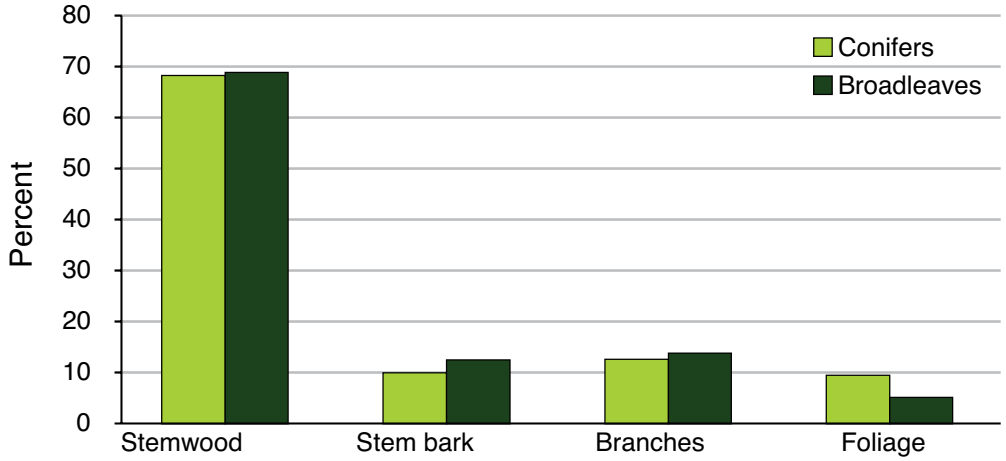

Figure 40. Distribution of biomass by component for coniferous and broadleaved species.

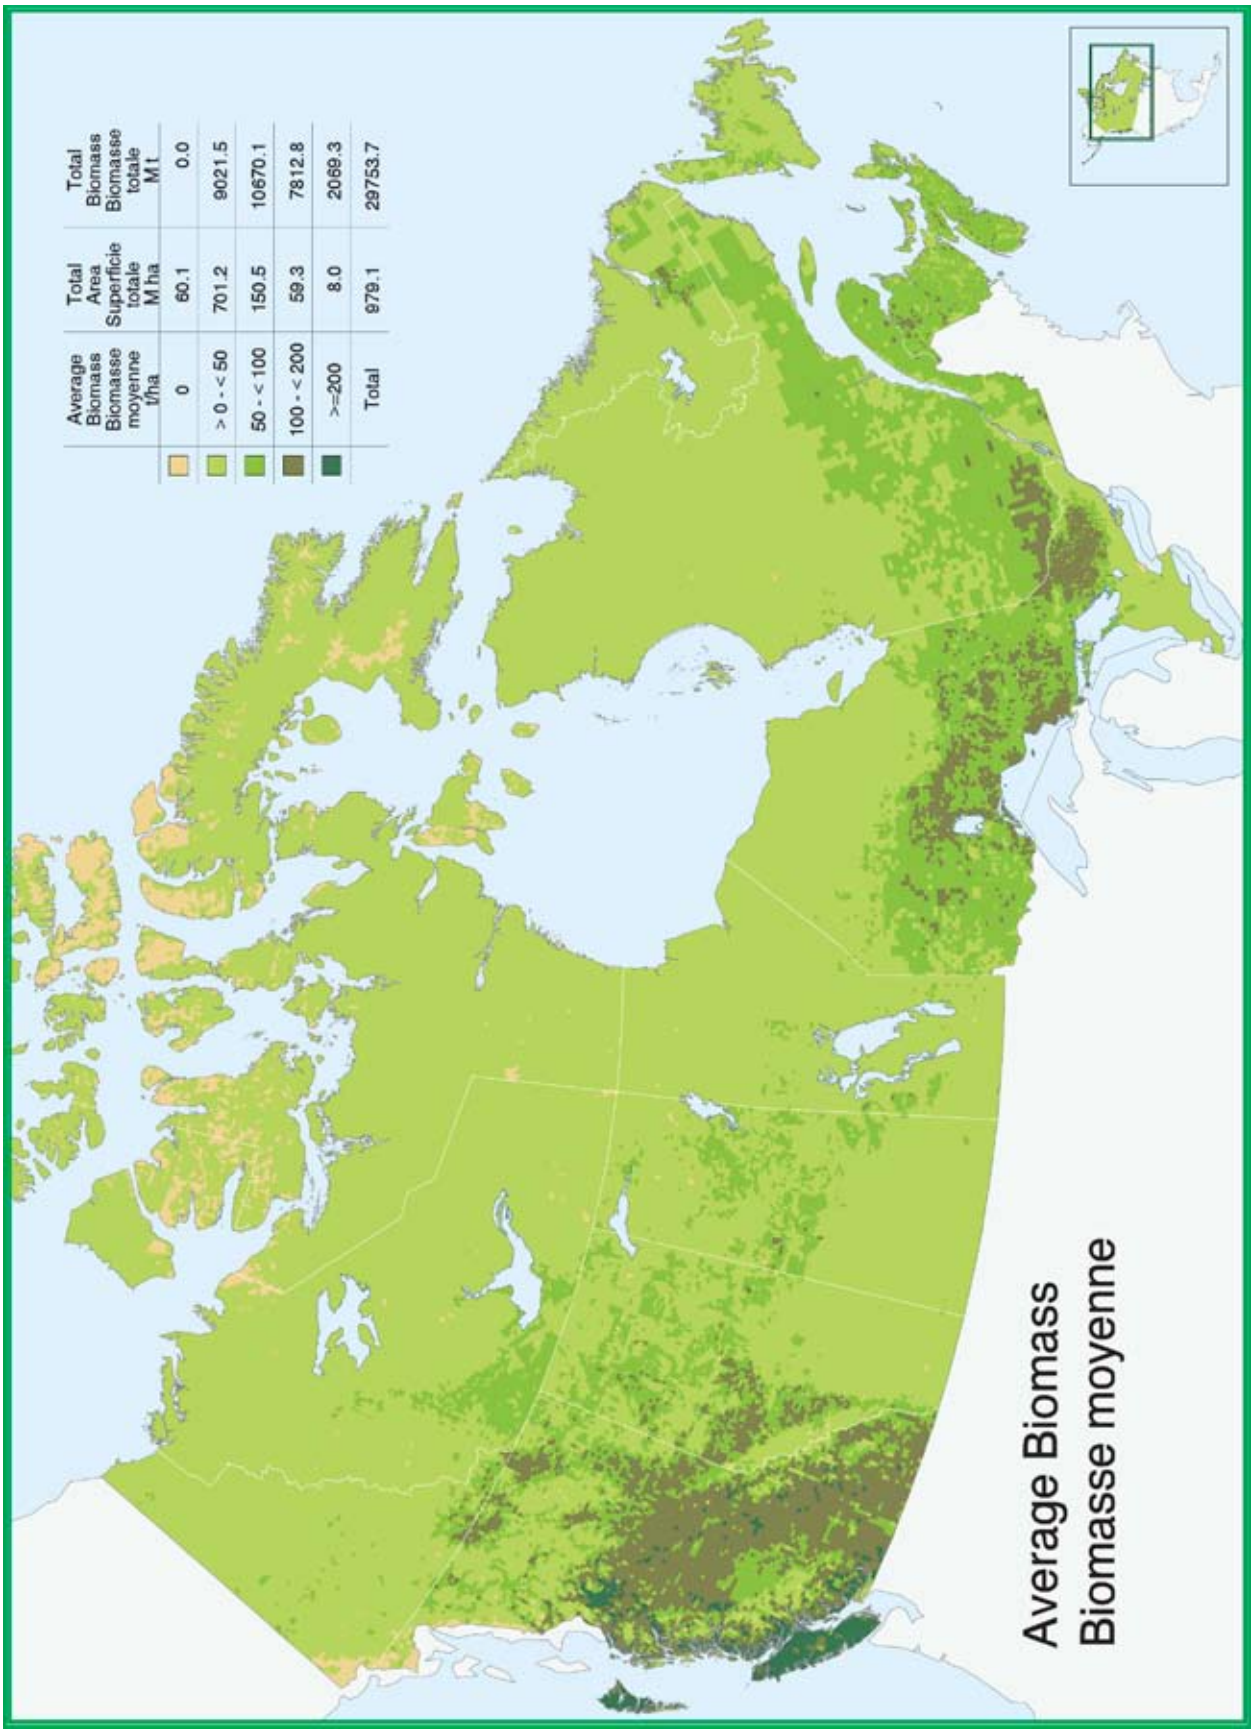

Figure 41. Average biomass

3.12 Access

Because of Canada's size, access to its forests is an important component in determining how much wood is available for harvesting. Figure 42 shows the pattern of road access in Canada, along with the area where forest occurs in more than 5% of a mapping unit. A mapping unit is classed as accessible if there is a road within it or on its border. Appendix I: Table I-31 describes, by province and territory, the area and volume reduced, or netted down, by applying various restrictions: forest and other wooded land; forest land; stocked forest; not reserved stocked forest; accessed not reserved stocked forest. Figure 43 illustrates netted-down area and volume for the country: stocked forest land has 100% of Canada's wood volume, whereas nonreserved stocked forest has 93.6% of the volume, and accessed nonreserved stocked forest has 59.3% of the volume. Area becomes netted down, from forest and other wooded land at 41.1% of the area of Canada, to accessed nonreserved stocked forest at 13.1% of the area of Canada.

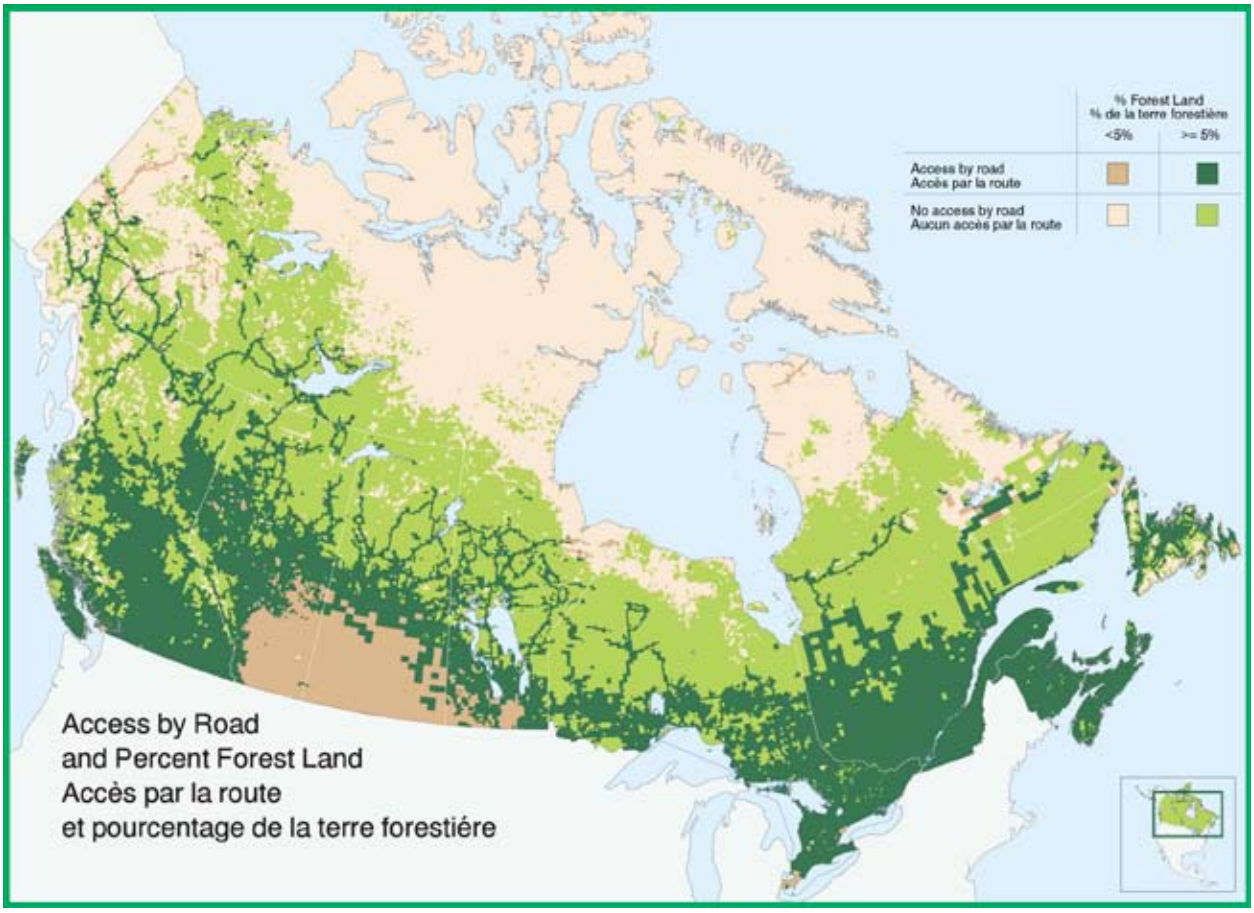

Figure 42. Access by road and percent forest land

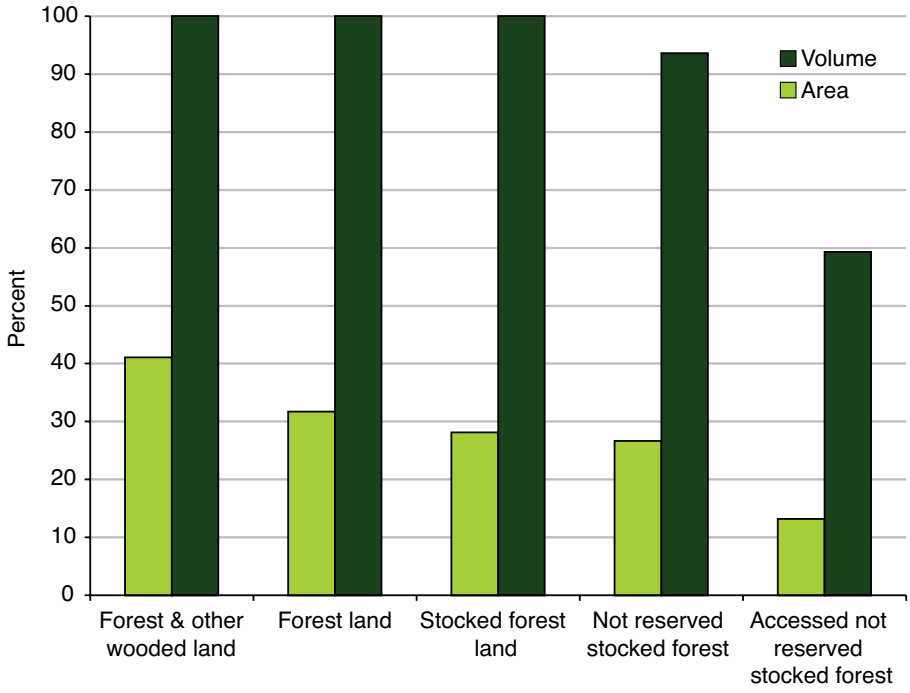

Figure 43. Area and volume percents netted down.

4. Regional Summaries

4.1 Forest Regions

Canada's forest geography was described by J.S. Rowe (1972) in *Forest Regions of Canada*. The criteria to define forest include "the distribution and range of conspicuous tree species, their life-forms (broadleaved or needle-leaved), the physiognomy and relative aerial extent of the communities in which they are associated, and the patterning of the total vegetation." The country is divided into forest regions (Figure 44), within which are nested forest sections. A forest region is "a major geographic belt or zone, characterized vegetationally by a broad uniformity both in physiognomy and in the composition of the dominant tree species." A forest section is "a geographic area possessing an individuality which is expressed relative to other sections in a distinctive patterning of vegetation and of physiography." The boundaries delineating these regions and sections have been digitized and combined with the CanFI2001 summary unit boundaries. Thus, whereas the above-mentioned report qualitatively describes the forest regions and sections, CanFI2001 quantifies the forest within them.

Table 17 summarizes the area and volume by forest region. According to it and to Figure 45, the boreal forest region comprises 196.3 million ha of forest and other wooded land, or just over 75% of Canada's total area, and contains 15 359.2 million m^3, or more than 50% of the total volume. The coast forest region accounts for only 1% of Canada's forest and other wooded land (5.1 million ha), but supports 9% of the total volume (20 646.7 million m^3).

Other analyses can be performed; the example serves to illustrate the capability.

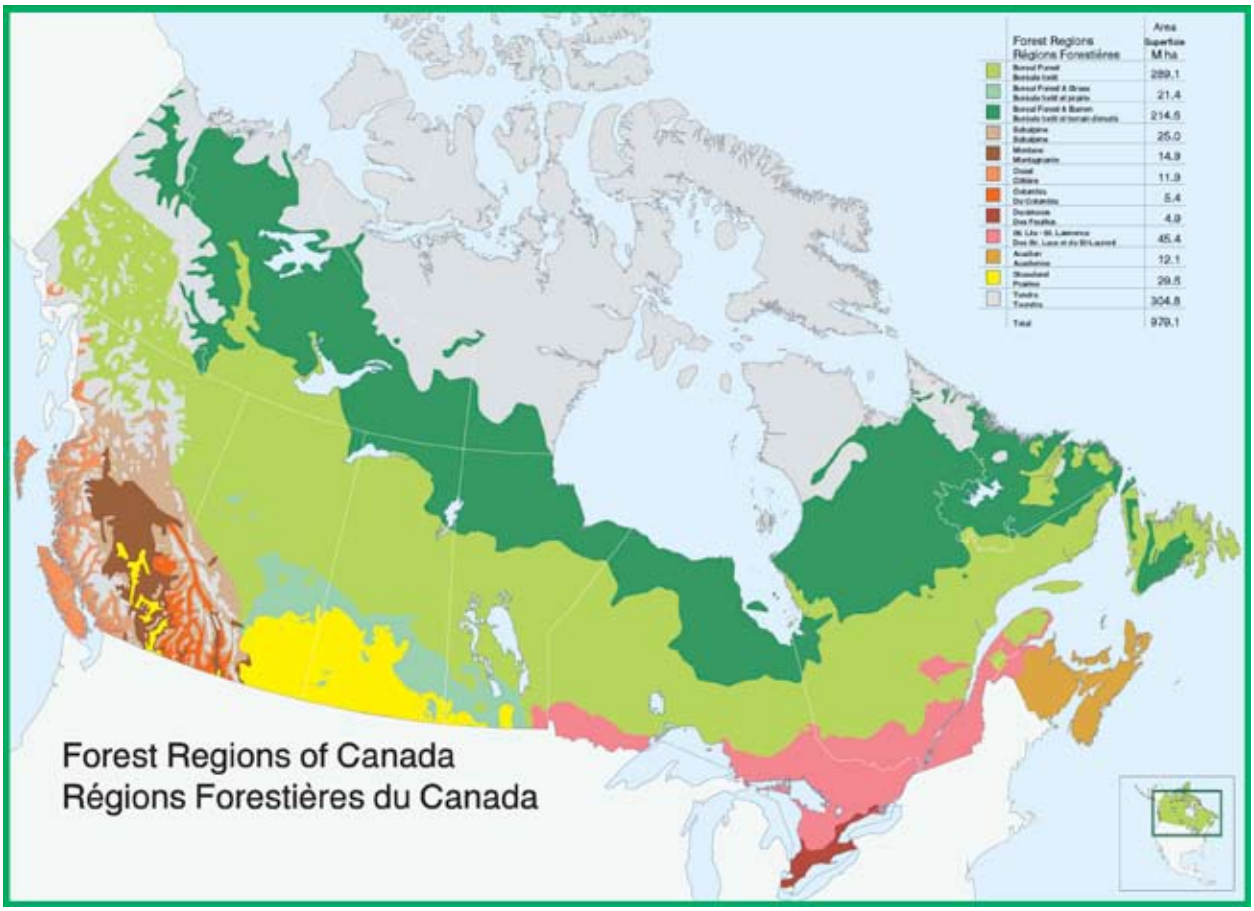

Figure 44. Forest regions of Canada

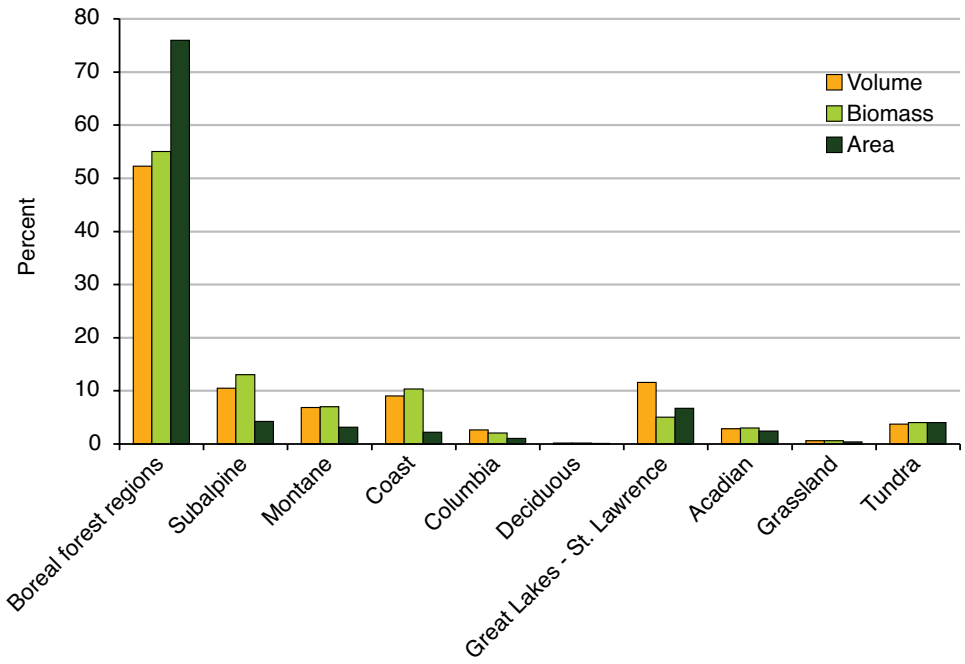

Figure 45. Volume, biomass, and area percents of forest and other wooded land by forest region.

4.2 Terrestrial Ecozones of Canada

The *National Ecological Framework for Canada* (Ecological Stratification Working Group 1995) describes an ecozone as "an area of the earth's surface representative of large and very generalized ecological units characterized by interactive and adjusting abiotic and biotic factors." Ecoregions are subdivisions of an ecozone, and are "characterized by distinctive regional ecological factors. Including climatic, physiography, vegetation, soil, water, fauna and land use." The report describes each of Canada's ecozone and ecoregion in terms of those factors. The boundaries of the ecozones and ecoregions have been digitized and combined with CanFI2001 summary-unit boundaries (Figure 46), so that conditions within them can be quantified.

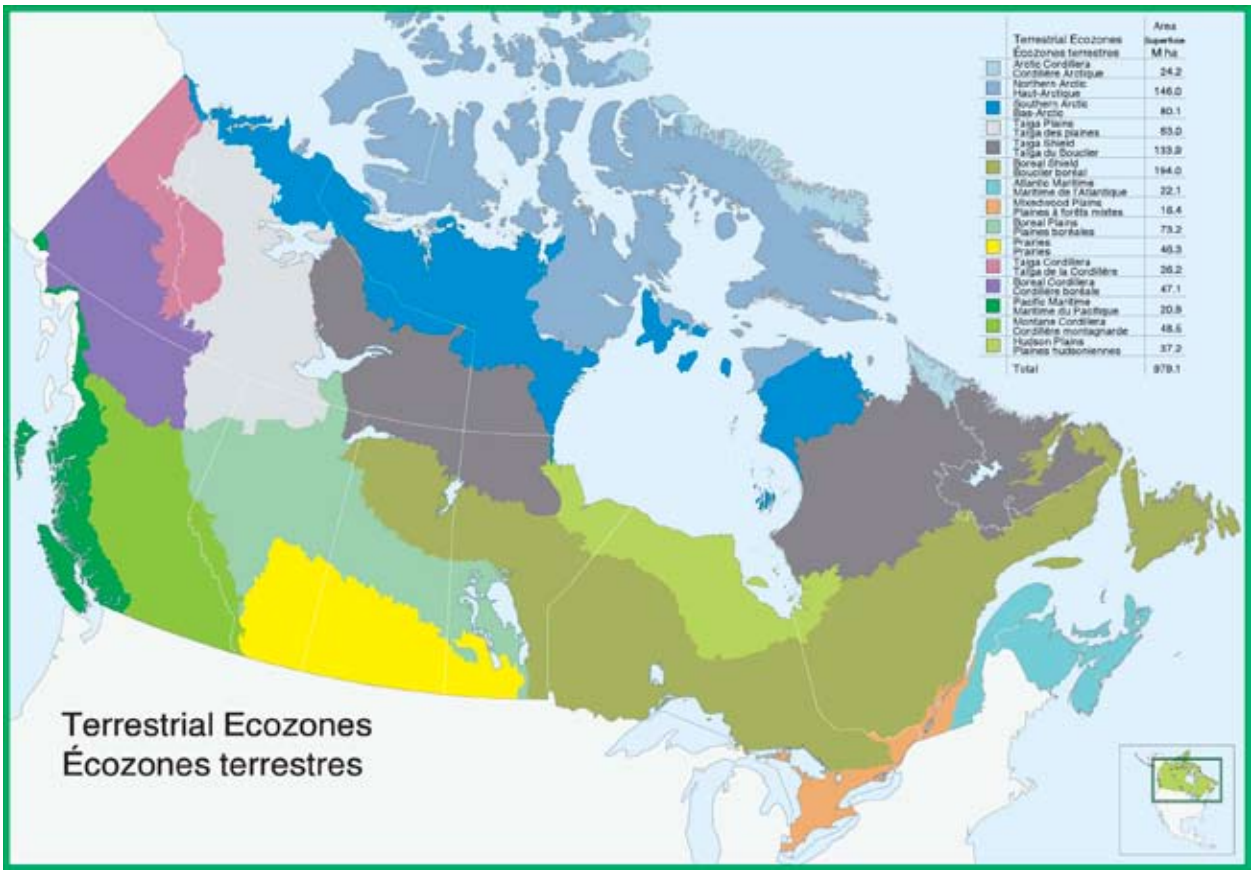

Figure 46. Terrestrial ecozones

Table 18 summarizes area and volume in each ecozone. The table and Figure 47 show:

- The Boreal Shield has the largest area of forest and other wooded land (almost 36% of the total) and supports 37% of the total volume;
- The Taiga Plains and Taiga Shield both have markedly larger percentages of forest and other wooded land compared to the wood volume they support (8.9% area compared to 4.6% volume, and 12% area compared to 2.3% volume, respectively);
- The Pacific Maritime ecozone contains only 3% of Canada's area of forest and other wooded land, but accounts for 12.2% of the wood volume;
- The Montane Cordillera has 8.9% of the forest and other wooded land area, but supports 19.8% of Canada's wood volume.

Other analyses can be performed; this example serves to illustrate the capability.

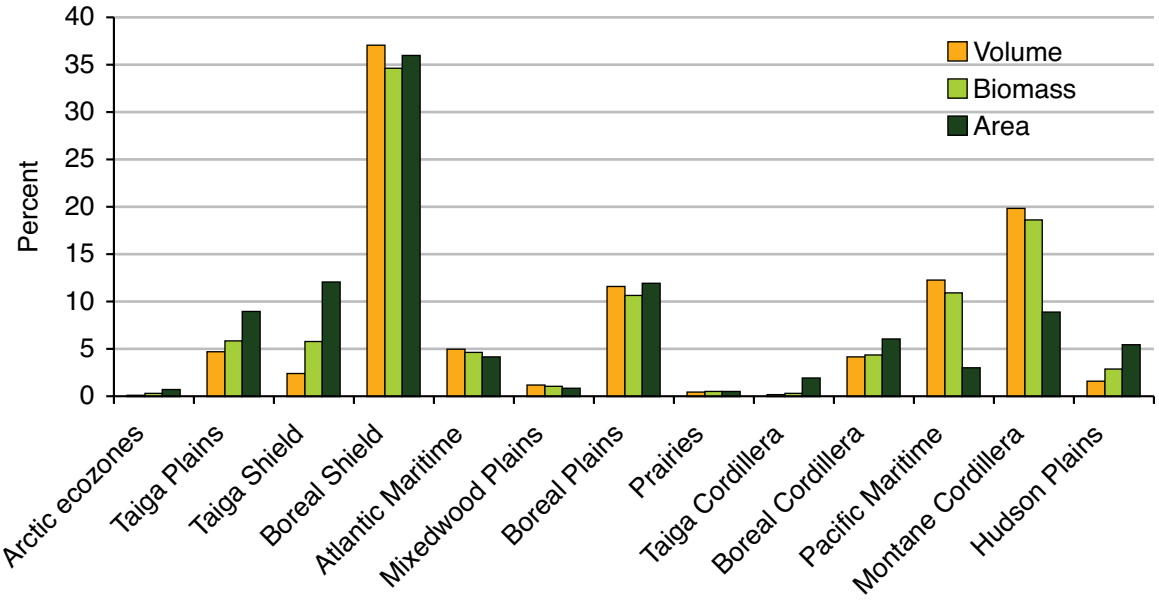

Figure 47. Area, volume, and biomass percentages of forest and other wooded land by terrestrial ecozone

4.3 Boreal Region

The previous two sections indicate the magnitude of forests in the boreal region in Canada. Their importance is also highlighted in the following:

- The theme of the 2005 National Forest Week was "The Boreal Forest: A Global Legacy" (Natural Resources Canada);
- *The State of Canada's Forests 2004-2005* (CFS 2005) report focuses on the boreal region.

Figure 48 shows the extent of Canada's boreal region. The boundaries of this region have been defined based on terrestrial ecozones, ecoregions and, in some cases, ecodistricts, which are subdivisions of an ecoregion. These boundaries have been applied to the CanFI2001 summary units, and the results are retained in the database, thereby allowing analyses of data within the boreal region to be performed.

Table 19 lists the terrestrial ecozones that make up Canada's boreal region, as well as area and percentage of each ecozone within the region.

Table 20 lists area in thousands of hectares for each of the nonvegetated land classes; Table 21 lists area, volume and biomass for each of the vegetated land classes. The boreal region spans 544.6 million ha.; of this, about 310 million ha are forest and other wooded land. Figure 49 compares the area percentage of grouped land classes in Canada to those in Canada's boreal region: the boreal region has a higher proportion of forest and of other wooded land than occurs in Canada as a whole; Canada has proportionately more agricultural land, naturally vegetated non-treed land, and naturally nonvegetated land than does the boreal region. The boreal region also has a greater proportion of fresh water than exists in all of Canada.

Table 22 and Figure 50 compare the total volume by forest type in Canada to that in the boreal region: the boreal region contains more than half of the total volume of Canada, with most volume occurring in softwood forest types. Canada as a whole has a much higher proportion of volume occurring in the softwood forest types than the boreal region does, due to the large volume that occurs in softwood forest types in British Columbia outside the boreal region—particularly along the coast.

Figure 51 compares the volume percent by grouped leading species in the boreal region to that in Canada. In general, the proportions are similar, with volume percent for other conifers being slightly higher in the boreal region, and spruces, pines, and firs contributing slightly higher percents of total volume in Canada than they do in the boreal region.

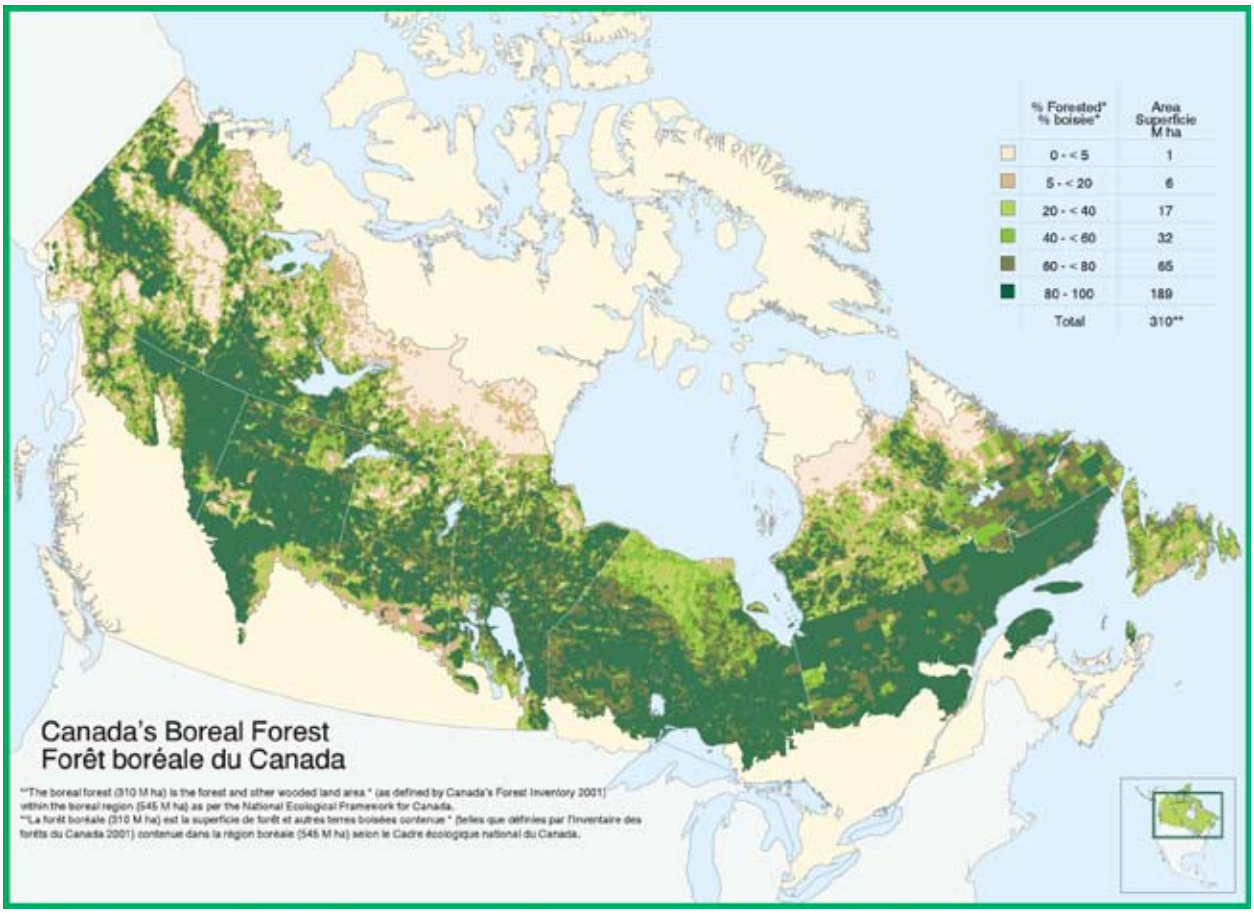

Figure 48. Canada's boreal region

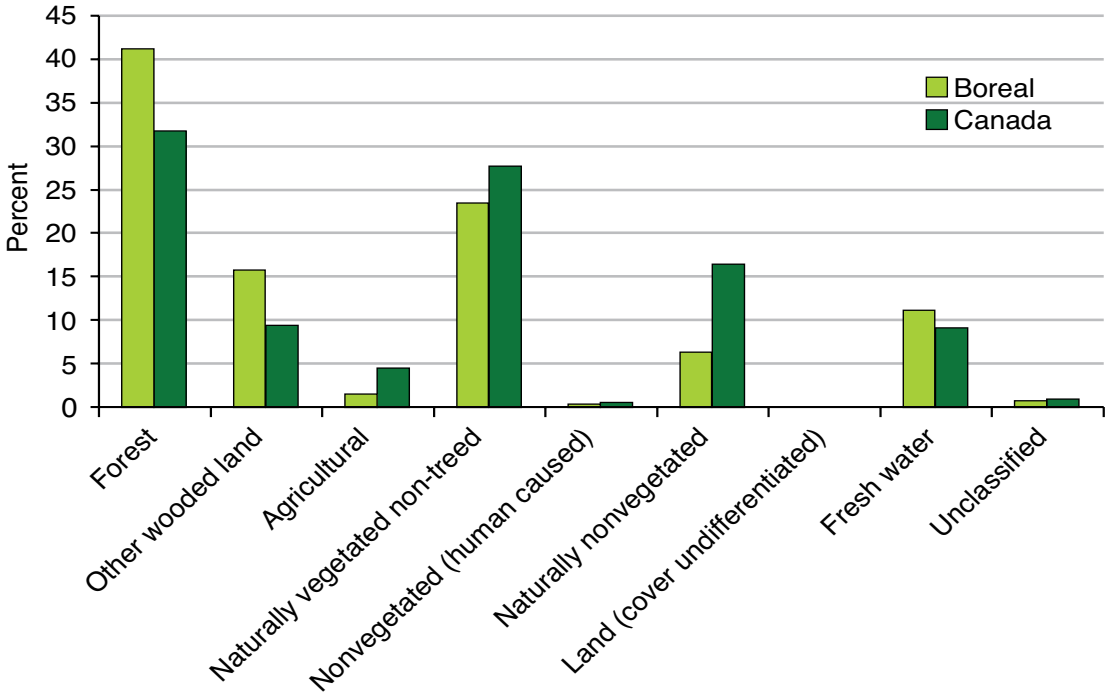

Figure 49. Area percent of land class in Canada and in the boreal region

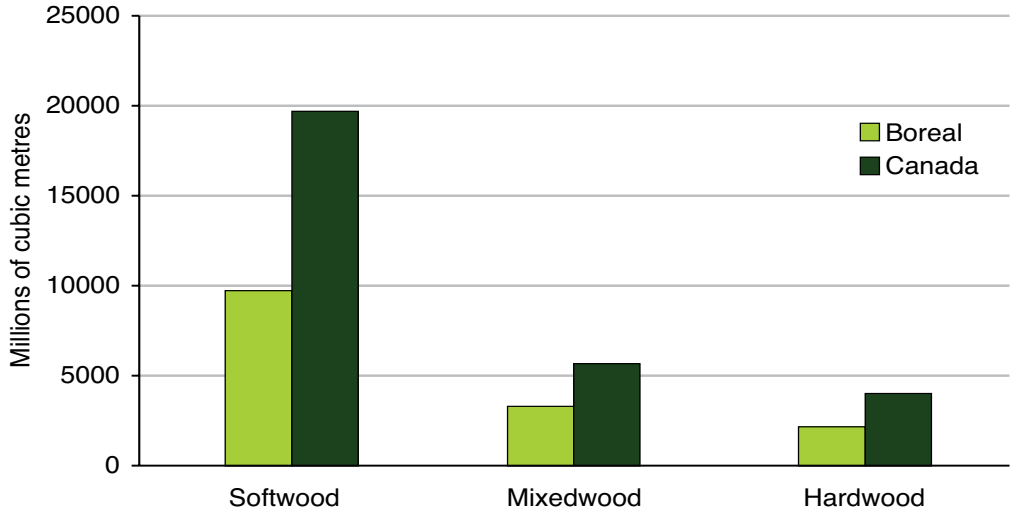

Figure 50. Total volume by forest type in the boreal region and Canada

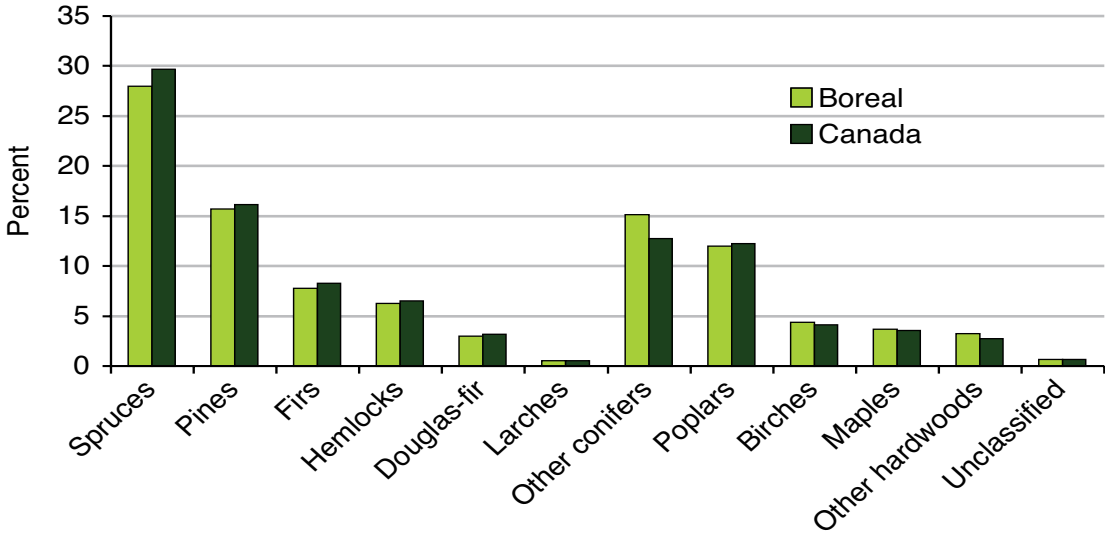

Figure 51. Volume percent by grouped leading species for the boreal region and Canada

5 Featured Analysis: Protected Areas

A question often asked, nationally and internationally, is "how much of Canada's forests are protected?" Because this information is not usually a part of provincial and territorial forest inventories, information from other provincial and territorial, as well as other federal, sources was used and integrated with CanFI2001 to describe forest resource and land cover in the protected areas.

In order to be able to report from CanFI2001 on regions other than provinces and territories, forest regions and sections, or ecozones and ecoregions, the geographic information (GIS coverage) describing the boundaries of the regions of interest must be intersected with the CanFI map sheet boundaries. This applies to protected areas as well as to any other reporting units.

Protected areas have been classified according to the International Union for the Conservation of Nature and Natural Resources (IUCN) classification system (IUCN 1994). The IUCN guidelines have been recognized internationally. The categories are defined in Table 23.

Protected area data (including GIS coverages) were used from all provinces and territories except Alberta, the Yukon and Nunavut. The data did not always include an IUCN protection class. Protected areas information from the Canadian Conservation Areas Database (CCAD; from geogratis.cgdi.gc.ca/ccea/ccea_e.html) was also used. CCAD data include GIS coverages for only a few of the protected areas in a province, but they do have IUCN classes for most protected areas. Where no provincial or territorial data were available, CCAD data were used. Where provincial data included IUCN classes for all protected areas (New Brunswick and Saskatchewan only), provincial data were the sole protected area data source used. Where CCAD data had IUCN classes and provincial data did not, the IUCN classes were used from CCAD data where protected area names were the same.

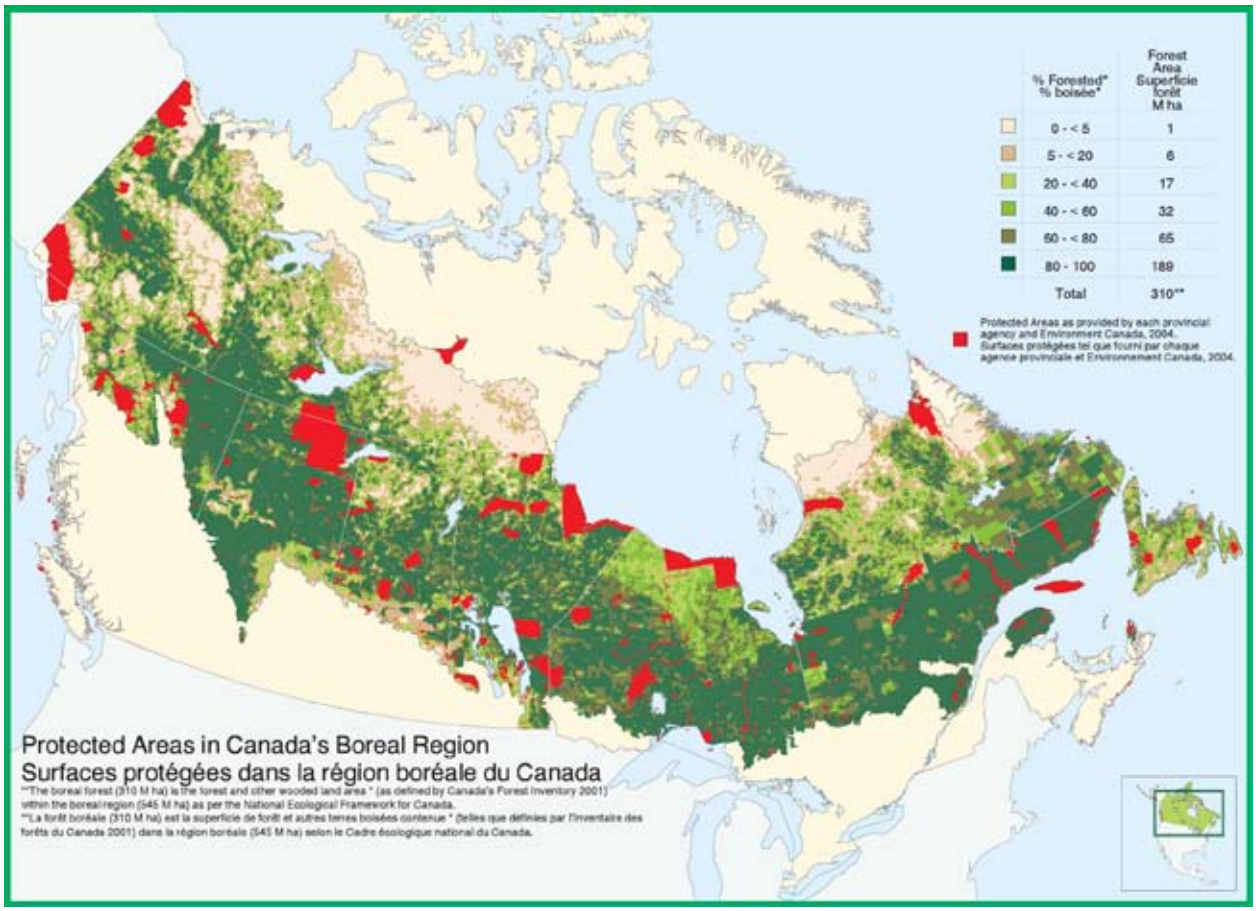

Figure 52. Protected areas in Canada's boreal region

There are about 27.8 million ha of protected areas listed in the CCAD database for which there are no geographic information and no corresponding data in the provincial or territorial data sets. As these valid protected areas could not be applied to CanFI2001, summaries by protected areas do not include these 27.8 million ha.

Figure 52 shows the protected areas in Canada's boreal region; Figure 53 shows that 11% of Canada's total land mass is protected. Figure 53 includes the 27.8 million ha that could not be applied to CanFI2001; the other figures that analyze CanFI2001 data based on protection do not include the 27.8 million ha. Figure 54 shows that about 8% of Canada's forest area is protected. The land class with the highest percentage of protected area is unclassified land—unclassified because the satellite imagery available for Nahanni National Park (a large protected area) included cloud cover.

Figure 55 shows that less than 10% of the area of three ecozones (Mixedwood Plains, Prairies, and Taiga Shield) are protected, whereas between 10% and 20% of the area of each of the other ecozones is protected. The Montane Cordillera and Boreal Cordillera have the highest percentage of protected area, because of the large number of national parks in these ecozones.

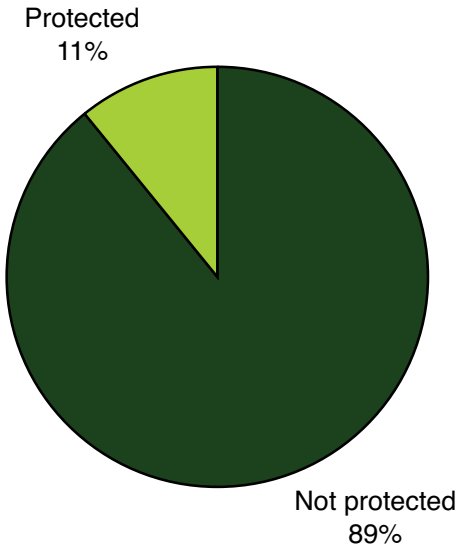

Figure 53. Protection status in Canada, including protected areas with no geographic information.

6 Summary

CanFI2001 is the latest statement on Canada's Forest Inventory. Compiled electronically at roughly five-year intervals since 1981 (in 1981, 1986, 1991 and 2001), CanFI collates the most recent provincial, territorial and other forest management inventories. It provides detailed, location-specific information on the characteristics and quantity of Canada's forests that is consistent with forest management information. It provides data that supports the Criteria and Indicator processes that monitor sustainable development, policy-making, national and international inquiries (for example, the United Nations Food and Agriculture Organization's Global Forest Resources Assessment), and reports on climate change. CanFI data is also made available to other government departments, research institutions, non-governmental organizations and the public. Before 1981, the national forest inventory was compiled on the basis of questionnaires completed by provincial and territorial forest management agencies.

Some of the improvements in CanFI2001 over previous versions include:

- Information for all of Canada, not only forested areas;
- More detailed description of the land and what is on it;
- Estimates of forest biomass.

There are differences between successive CanFI reports: some differences reflect real change resulting from either a natural or human-caused change in forest condition; other differences are artifacts of change resulting from modifications in procedures, standards and definitions between successive inventories. For example, changing the definition of forest from a minimum of 20% crown closure to 10% crown closure would result in increased forest area totals. Similarly, more precise methodologies could result in changes to forest estimates.

There is a difference in the area classified as forest between 1991 and 2001. Forest area (including other wooded land) is now estimated to be 402.1 million ha, down from 417.6 million ha in 1991. This is likely due to changes in methodology that have affected estimates. For example, CanFI2001's area estimates for northern Canada are based on interpretation of coarse-resolution satellite data, which improves the ability to differentiate forest from non-forest areas relative to previous methods. Thus, areas that were previously thought to be forested are, in fact, not. Finer-resolution data available in the future will improve ability to define area of forest and could result in further changes. The difference in estimates for southern Canada is much smaller. Estimates have improved as provinces have improved their inventory methodologies; this is another factor in the difference in forest area.

CanFI2001 was designed to provide the best available information on the characteristics and quantity of Canada's forests; it was not designed to assess change over time. Comparing summaries between successive CanFI reports may be misleading without detailed background knowledge.

Canada's current national inventory is a periodic compilation of existing inventory from across the country. Although the current approach has many advantages, it lacks information on the nature and rate of changes to the resource, and does not permit projections or forecasts. Being a compilation of inventories of different dates that were collected to varying standards, the current national forest inventory, although consisting of the best available information, cannot reflect the current state of the forests and, therefore, should not be used as a satisfactory baseline for monitoring change.

To address the need to determine change over time and to support increasing demands for additional forest resource information, the Canadian Forest Inventory Committee, a sub-committee of the Canadian Council of Forest Ministers Information and Knowledge Working Group, has developed a different approach for the National Forest Inventory (NFI): a plot-based system of permanent observational units

located on a national grid. The NFI will collect accurate and timely information on the extent and state of Canada's forests to establish the baseline of where the forests are and how they are changing over time. The core NFI design, described in *Canada's National Forest Inventory – Design Overview* (CFS, 2004), is being implemented in cooperation with the provinces and territories.

Table 1. Range of areas for entire map sheets for the different maps used for CanFI2001

		Approximate range of map areas (ha) where maps not intersected with coastlines or other boundaries	
Province/territory	Map sheet type	Lower	Upper
Newfoundland and Labrador	1/16th of 1:50 000 NTS map	5 250	6750
	UTM	9 280	9 580
	1:50 000 NTS map	82 800	93 350
Nova Scotia	ND Ortho 1:10 000	3 000	3 135
	Digital 1:10 000	4 300	4 700
Prince Edward Island		4 312	4 412
New Brunswick	1:10 000, 7.5 km × 5.5 km	4 480	4 600
Quebec	UTM	9 410	9 780
	1/25th of 1:50 000 NTS map	23 600	28 500
	1:50 000 NTS map	91 000	99 300
Ontario	1:10 000, 5000 m × 5000 m	2 560	2 595
	UTM	9 560	9 890
	1:20 000, 10 km × 10 km	9 850	10 250
	1/4th 1:50 000 NTS map	23 200	25 200
	Township (av. 20 798 ha)	10	48 465
Manitoba	Township	8 520	10 200
	UTM	9 450	9 620
Saskatchewan	Township	9 000	9 680
	UTM	9 460	9 760
	Large	89 900	101 200
Alberta	Township	9 250	9 300
	UTM	9 700	9 850
	Indian reserves (av. 4436 ha)	2	27 322
British Columbia	1/100th 1:250 000 NTS map	11 800	16 200
Yukon	UTM	9 450	9 490
Northwest Territories	UTM	9 450	10 200
Nunavut	UTM	9 750	11 100

Table 2. Data origin and vintage (area weighted mean year)

Data origin	Area Percentage of Canada	Vintage
Satellite imagery	55.6	1995
New provincial/territorial data	26.9	1985
Data re-used from CanFI1991	11.9	1983
Old provincial/territorial data resubmitted	3.8	1975
Ecological study/other study/CFS	1.8	1998

Table 3. Area summaries by province and territory

Province/ territory	Area (million ha)						
	Land	Fresh water	Not classified	Total	Forest & other wooded land	Forest	Stocked forest

Canada	19 689	5 648	3 996	50	29 383

Table 23. IUCN protected area categories and definitions

Category	**Name**	**Definition**
Ia	**Strict Nature Reserve:** protected area managed mainly for science	Area of land and/or sea possessing some outstanding or representative ecosystems, geological or physiological features and/or species, available primarily for scientific research and/or environmental monitoring
Ib	**Wilderness Area:** protected area managed mainly for wilderness protection	Large area of unmodified or slightly modified land, and/or sea, retaining its natural character and influence, without permanent or significant habitation, which is protected and managed so as to preserve its natural condition
II	**National Park:** protected area managed mainly for ecosystem protection and recreation	Natural area of land and/or sea, designated to (a) protect the ecological integrity of one or more ecosystems for present and future generations, (b) exclude exploitation or occupation inimical to the purposes of designation of the area and (c) provide a foundation for spiritual, scientific, educational, recreational and visitor opportunities, all of which must be environmentally and culturally compatible
III	**Natural Monument:** protected area managed mainly for conservation of specific natural features	Area containing one, or more, specific natural or natural/ cultural feature, which is of outstanding or unique value because of its inherent rarity, representative or aesthetic qualities or cultural significance
IV	**Habitat/Species Management Area:** protected area managed mainly for conservation through management intervention	Area of land and/or sea subject to active intervention for management purposes so as to ensure the maintenance of habitats and/or to meet the requirements of specific species
V	**Protected Landscape/Seascape:** protected area managed mainly for landscape/seascape conservation and recreation	Area of land, with coast and sea as appropriate, where the interaction of people and nature over time has produced an area of distinct character with significant aesthetic, ecological and/or cultural value, and often with high biological diversity. Safeguarding the integrity of this traditional interaction is vital to the protection, maintenance and evolution of such an area
VI	**Managed Resource Protected Area:** protected area managed mainly for the sustainable use of natural ecosystems	Area containing predominantly unmodified natural systems, managed to ensure long term protection and maintenance of biological diversity, while providing at the same time a sustainable flow of natural products and services to meet community needs

Appendix II. CanFI2001 Codes and Descriptions

Province/Territory

Code	Description
0	Newfoundland and Labrador – Newfoundland
1	Newfoundland and Labrador – Labrador
2	Nova Scotia
3	Prince Edward Island
4	New Brunswick
5	Quebec
6	Ontario
7	Manitoba
8	Saskatchewan
9	Alberta
10	British Columbia
11	Yukon
12	Northwest Territories
13	Nunavut

Data Source

Code	Description	Definition
1	Reconnaissance	An exploratory, extensive inventory with no detailed estimates obtained
2	Regional	A detailed, extensive forest inventory for planning on a regional or provincial basis
3	Management	A detailed, intensive forest inventory for management purposes of an area managed as one unit
6	Satellite	Land classification based on satellite imagery
7	Other inventory sources	Ecological land classifications of national parks; record added by Canadian Forest Service
8	No information	

Ownership

Code	Description	Definition
11	Federal crown	Crown land within the jurisdiction of the federal government, except for land under the jurisdiction of Indian and Northern Affairs Canada.
12	Native	Land within an Indian Reserve or Indian Settlement
13	Provincial/territorial crown	Crown land within the jurisdiction of a provincial or territorial government or Northern Affairs of Indian and Northern Affairs Canada
14	Municipal	Land that is the property of a municipality or other government agency
20	Private unspecified	Land owned by corporations or individuals at an unknown scale of operation
21	Private industrial	Land owned by a large corporate industry for commercial forestry purposes
22	Private non-industrial	Land owned by corporations or individuals that may or may not be used for commercial forestry purposes
-8	Unknown	No information

Status

Code	Description	Definition
10	Reserved	Land that by law or policy is not available for timber harvest
21	Nonreserved - assigned	Crown-owned land no longer under the direct control of the Crown
22	Nonreserved - retained	Crown-owned land under the direct, immediate control of the Crown
23	Nonreserved - other	Land that is not reserved from timber harvest by law or policy
-8	Unknown	No information

Land Class

Code	Description	Definition
10000	Water (undifferentiated)	Includes lakes, rivers, streams, ponds, etc.
11000	Lake/pond/reservoir	
12000	Large lake	Lake with surface area larger than 4000 km^2
12001	St. Lawrence River	
13000	River/stream/flowage	
20000	Land (cover undifferentiated)	
21000	Nonvegetated (origin undifferentiated)	
21100	Naturally non-vegetated	
21110	Rock	Barren rock with less than 25% tree cover
21111	Rubble/talus/rock glacier	
21120	Sand	Sand with trees (if any) having less than 10% crown closure
21130	Barren soil	Area with <25% live tree cover containing ericaceous vegetation with <50% rock outcrops and <50% other woody plant cover. Area is not wet.
21140	Recent/unproductive burn	Severely burned forest land that is no longer forest due to factors such as the severity of the fire, erosion, and adverse microclimatic conditions
21150	Mud/salt flat	A tract of low muddy land near an estuary, covered at high tide and exposed at low tide, or a flat expanse of salt left by the evaporation of salt water
21151	Flooded land	Areas periodically inundated with water
21160	Gravel bar/stream channel	
21170	Clay bank/cut bank	
21180	Alpine	Includes nonforested land above timberline and contiguous areas of rock, glaciers, non-productive brush and snow slides
21190	Ice/icefield	
21200	Anthropogenically non-vegetated	Cleared land where cause not identified
21210	Cleared land	Land where vegetation has been removed
21220	Gravel pit/quarry/mine site/ oil field/peat extraction	Land cleared for the stated uses
21230	Urban/cities/residential	Land cleared for human habitation
21240	Right-of-way	Land cleared for roads, railways, power lines, and pipelines
21241	Road	Land cleared for roads
21242	Railway	Land cleared for railway lines
21243	Transmission line	Land cleared for transmission lines

Code	Description	Definition
21244	Pipeline	Land cleared for pipelines
21250	Airstrip	Land cleared for airstrips
21260	Harvested or burned	Firebreak or landing/slash pile area
22000	Vegetated (origin and type undifferentiated)	
22100	Naturally vegetation non-treed	
22110	Wetland	Wetlands not falling into categories below
22111	Muskeg/bog/fen	Wetlands typically covered by peat, having a saturated water regime, and frequently covered by ericaceous shrubs, sedges, and sphagnum moss
22112	Marsh	Wetland completely or partially covered with tall grass, rushes, or sedges and less than 25% cover of ericaceous woody plants
22113	Meadow	Land that may be flooded intermittently and usually contains an accumulation of peat, covered by sedges, reed grasses, rushes, and other hydrophytic vegetation with larger shrubs amounting to less than 50% of the vegetative cover
22114	Shrub	Similar to meadow, except that the larger shrubs (willow, alder, etc.) amount to more than 50% of the vegetative cover
22115	Supertidal marsh	Coastal marshes of the Hudson Bay – James Bay Lowland lying inland of the coastal mudflat and intertidal marsh areas and subject to only exceptionally high tides
22120	Upland shrub	
22121	Alders	Land (not wetland) where the dominant vegetation is alders
22122	Brush/avalanche scrub/ riparian banks	Shrubby areas not on lowlands, on avalanche tracks, and along rivers or streams
22130	Other	
22131	Grassland/meadow	Moist, low lying and usually flat land with sedges and graminoids predominant
22132	Open range	Nonforested range that may have from 6 to 10% crown cover of trees
22133	Mosses	Mosses and/or bryophytes
22134	Tundra – shrub and lichen	Barren land in which shrubs and lichen are the dominant cover type
22135	Tundra heath	Areas of dense ericaceous vegetation occurring on better-drained land
22136	Alvar	Grasslands on calcareous soils
22200	Anthropogenically vegetated non-treed	
22210	Agriculture/crops	Land cleared for agriculture purposes – includes farm crops, market gardens, orchards, hay fields, blueberry production, etc.
22220	Pasture	Open grassland (primarily used for grazing livestock) with less than 10% crown closure of woody shrubs
22300	Vegetated treed	
22310	Wetland	

Code	Description	Definition
22311	Treed muskeg/treed bog	Like muskeg/bog/fen but with more than 10% crown closure of trees
22312	Forested wetland/swamp	Low land that is seasonally flooded and has more woody plants than a marsh and better drainage than a bog
22320	Scattered	
22321	Treed rock	Rock with very shallow soil with tree cover amounting to more than 10% crown closure
22322	Small island/shelter belt	Areas of trees less than 2 ha in size or running in a belt along field edges and usually planted
22323	Alpine forest	High elevation forest located adjacent to alpine areas
22324	Wooded prairie/aspen parkland	Deciduous forests of trembling aspen, willow, white birch, balsam poplar, white elm, green ash, and Manitoba maple are intermingled with grassland, with a pattern of grasslands on ridges and south-facing slopes and trees in depressions and north-facing slopes
22325	Wind swept/stunted	Very open, sparse, patchy, stunted. Coniferous and deciduous scrub
22330	Recreation	Golf courses, camp grounds, recreational sites
22340	Forest	A plant community predominantly of trees and other woody vegetation, growing more or less closely together
-8	Missing value	No information

Site Quality

Code	Description
7.5	Site class 1: Trees grow to 5.0 to 9.9 m in height at 50 years (100 years in Yukon)
12.5	Site class 2: Trees grow to 10.0 to 14.9 m in height at 50 years (100 years in Yukon)
17.5	Site class 3: Trees grow to 15.0 to 19.9 m in height at 50 years (100 years in Yukon)
22.5	Site class 4: Trees grow to 20.0 to 24.9 m in height at 50 years (100 years in Yukon)
27.5	Site class 5: Trees grow to 25.0 to 29.9 m in height at 50 years (100 years in Yukon)
32.5	Site class 6: Trees grow to 30.0 to 34.9 m in height at 50 years (100 years in Yukon)
37.5	Site class 7: Trees grow to 35.0 m and greater in height at 50 years (100 years in Yukon)
-8	Missing value – no information
-9	Not applicable – for land classes other than forest (22340)

Stocking Class

Code	Class	Definition
100	Nonstocked	Forest land that lacks trees completely or that is so deficient in trees, either young or old, that the residual stand trees, if any, is insufficient to allow for use according to the management objectives for the land
200	Stocking not known	Forest land that has tree cover removed or killed (reason not specified) and the subsequent degree of stocking has not been assessed
210	Disturbed	Forest land that has tree cover removed or killed by some disturbance (not specified) and the subsequent degree of stocking has not been assessed
211	Burn	Forest land that has tree cover removed or killed by fire and the subsequent degree of stocking has not been assessed

Code	Class	Definition
212	Harvest	Forest land that has tree cover removed or killed by harvesting and the subsequent degree of stocking has not been assessed
213	Windthrow	Forest land that has tree cover removed or killed by windthrow and the subsequent degree of stocking has not been assessed
214	Insect/disease	Forest land that has tree cover removed or killed by insect or disease and the subsequent degree of stocking has not been assessed
215	Other disturbance	Forest land that has tree cover removed or killed by other disturbance and the subsequent degree of stocking has not been assessed
216	Abandoned farmland	Abandoned farmland that is returning to forest cover where stocking has not been assessed
220	Not measured	Forest land where stocking is not known because it has not been assessed
221	Experimental areas	Seed orchards
300	Stocked	Land supporting tree growth, density not specified
310	Regenerating/plantation	Planted or seeded areas not yet tall enough for the degree of stocking to be assessed
320	Partially	Stocked forest land where yield is significantly reduced and treatment may be considered
330	Fully	Stocked forest land where yield is generally reasonable for extensive management and treatment is generally not considered
-8	Missing value	No information
-9	Not applicable	For land classes other than forest

Age Class

Code	Class
0	1 to 5 years
1	1 to 20 years
2	21 to 40 years
3	41 to 60 years
4	61 to 80 years
5	81 to 100 years
6	101 to 120 years
7	121 to 140 years
8	141 to 160 years
9	161 to 180 years
10	181 to 200 years
11	201 to 220 years
12	221 to 240 years
13	241 to 260 years
14	261 to 280 years
15	281 to 300 years
16	301 to 320 years
17	321 to 340 years
18	341 to 360 years
19	361 to 380 years
20	380 to 400 years
21	401+ years
-5	Uneven-aged
-8	Missing value
-9	Not applicable—not stocked forest

Maturity Class

Code	Class	Definition
1	Regeneration	The renewal of a forest crop by natural or artificial means. Also the new crop so obtained (5). The new crop is generally less than 1.3 m in height (1). In this context it is the new crop, not the act of renewal, that is being described. CanFI data may include volume of trees that survived disturbances such as fire or harvesting.
2	Immature	In even-aged management, those trees or stands that have grown past the regeneration stage but are not yet mature.
3	Mature	In even-aged management, those trees or stands that are significantly developed to be harvestable and that are at or near rotation age (includes overmature trees and stands if an overmature class has not been recognized) (1).
4	Overmature	In even-aged management, those trees or stands past the mature stage (1).
5	Uneven-aged	A forest, stand, or forest type in which relatively small differences exist between individual trees(1). To be classified as even-aged, the maximum difference in age permitted it is usually 10 to 20 years; if the stand will not be harvested until it is 100 to 200 years old, larger differences of up to 25 percent of the rotation age may be allowed.
-8	Missing value	No information available
-9	Not applicable	For records that are not stocked forest land

Forest Type

Code	Class	Definition
1	Softwood	Stocked forest land where 76 to 100% of the canopy is coniferous
2	Mixedwood	Stocked forest land where 26 to 75% of the canopy is coniferous
3	Hardwood	Stocked forest land where 0 to 25% of the canopy is coniferous
-8	Missing value	No information available
-9	Not applicable	For records that are not stocked forest land

Predominant Genus

Code	Class	Definition
1	Spruce	Most abundant tree genus is *Picea*
2	Pine	Most abundant tree genus is *Pinus*
3	Fir	Most abundant tree genus is *Abies*
4	Hemlock	Most abundant tree genus is *Tsuga*
5	Douglas-fir	Most abundant tree genus is *Pseudotsuga*
6	Larch	Most abundant genus is *Larix*
7	Cedar and other conifers	Most abundant genus is one of *Thuja, Juniperus, Taxus*, or *Chamaecyparis*
8	Unspecified conifers	Most abundant genus identified as conifer only
9	Poplar	Most abundant tree genus is *Populus*
10	Birch	Most abundant tree genus is *Betula*
11	Maple	Most abundant tree genus is *Acer*
12	Other broadleaved species	Most abundant genus is one of *Carya, Juglans, Alnus, Ostrya, Carpinus, Fagus, Quercus, Ulmus, Morus, Liriodendron, Magnolia, Sassafras, Platanus, Prunus, Gleditsia, Robinia, Tilia, Nyssa, Cornus, Arbutus, Fraxinus, Salix, Gymnocladus, Celtis, Amelanchier, Corylus, Crataegus, Ilex, Malus, Nemopanthus, Rhus*, or *Sorbus*
13	Unspecified broadleaved species	Most abundant genus identified as broadleaved only
-8	Missing value	No information available
-9	Not applicable	For records that are not stocked forest land

First Species

Code	Common name	Scientific name
100	Spruce	*Picea*
101	Black spruce	*Picea mariana* (Mill.) BSP
102	Red spruce	*Picea rubens* Sarg.
103	Norway spruce	*Picea abies* (L.) Karst.
104	Engelmann spruce	*Picea engelmannii* Parry ex Engelm.
105	White spruce	*Picea glauca* (Moench) Voss
106	Sitka spruce	*Picea sitchensis* (Bong.) Carrière
107	Black and red spruce	*Picea mariana* (Mill.) BSP and *Picea rubens* Sarg.
108	Red and white spruce	*Picea rubens* Sarg. and *Picea glauca* (Moench) Voss
109	Other spruce	*Picea* spp. excluding *P. mariana* and *P. rubens*
110	Spruce and balsam fir	*Picea spp.* and *Abies balsamea* (L.) Mill.
200	Pine	*Pinus*
201	Western white pine	*Pinus monticola* Dougl. ex D. Don
202	Eastern white pine	*Pinus strobus* L.
203	Jack pine	*Pinus banksiana* Lamb.
204	Lodgepole pine	*Pinus contorta* Dougl. ex Loud. var. *latifolia* Engelm.
205	Shore pine	*Pinus contorta* var. *contorta*
206	Whitebark pine	*Pinus albicaulis* Engelm.
207	Austrian pine	*Pinus nigra* Arnold
208	Ponderosa pine	*Pinus ponderosa* P. Laws. ex C. Laws.
209	Red pine	*Pinus resinosa* Ait.
210	Pitch pine	*Pinus rigida* Mill.
211	Scots pine	*Pinus sylvestris* L.
212	Mugho pine	*Pinus mugo* Turra
213	Limber pine	*Pinus flexilis* James
214	Jack, lodgepole, and shore pine	*Pinus banksiana* Lamb., *Pinus contorta* Dougl. ex Loud. var. *latifolia* Engelm., and *Pinus contorta* var. *contorta*
215	Other pine	*Pinus spp.* excluding the two white pines, and the jack pine group
216	Hybrid jack and lodgepole pine	
217	Whitebark and limber pine	*Pinus albicaulis* Engelm. and *Pinus flexilis* James
300	Fir	*Abies*
301	Amabilis fir	*Abies amabilis* (Dougl. ex Loud.) Dougl. ex. J. Forbes
302	Balsam fir	*Abies balsamea* (L.) Mill.
303	Grand fir	*Abies grandis* (Dougl. ex D. Don) Lindl.
304	Subalpine fir (or alpine fir)	*Abies lasiocarpa* (Hook.) Nutt.
305	Balsam and alpine fir	*Abies balsamea* (L.) Mill. and *Abies lasiocarpa* (Hook.) Nutt.
306	Alpine, amabilis, and grand fir	*Abies lasiocarpa* (Hook.) Nutt., *Abies amabilis* (Dougl. ex Loud.) Dougl. ex. J. Forbes, and *Abies grandis* (Dougl. ex D. Don) Lindl.
307	Japanese fir	*Abies firma*
320	Spruce and balsam fir	*Picea* and *Abies balsamea* (L.) Mill.
321	Balsam fir and spruce	*Abies balsamea* (L.) Mill. and *Picea*
400	Hemlock	*Tsuga*
401	Eastern hemlock	*Tsuga canadensis* (L.) Carrière
402	Western hemlock	*Tsuga heterophylla* (Raf.) Sarg.
403	Mountain hemlock	*Tsuga mertensiana* (Bong.) Carrière
404	Western and mountain hemlock	*Tsuga heterophylla* (Raf.) Sarg. and *Tsuga mertensiana* (Bong.) Carrière

Code	Common name	Scientific name
500	Douglas-fir and Rocky Mountain Douglas-fir	*Pseudotsuga menziesii* var. *menziesii*(Mirb.) Franco, and *Pseudotsuga menziesii* var. *glauca* (Beissn.) Franco
600	Tamarack/larch	*Larix*
601	European larch	*Larix decidua* Mill.
602	Tamarack	*Larix laricina* (Du Roi) K. Koch
603	Western larch	*Larix occidentalis* Nutt.
604	Subalpine larch	*Larix lyallii* Parl.
605	Japanese larch	*Larix kaempferi* (Lamb.) Carrière
700	Cedar	*Thuja*
701	Eastern white-cedar	*Thuja occidentalis* L.
702	Western redcedar	*Thuja plicata* Donn ex D. Don
703	Cedar and other conifers	*Thuja, Juniperus, Taxus,* and *Chamaecyparis*
800	Juniper	*Juniperus*
801	Eastern redcedar	*Juniperus virginiana* L.
802	Rocky Mountain juniper	*Juniperus scopulorum* Sarg.
900	Yew	*Taxus*
901	Western yew	*Taxus brevifolia* Nutt.
1000	Cypress	*Chamaecyparis*
1001	Yellow cypress	*Chamaecyparis nootkatensis* (D. Don) Spach
1100	Other softwoods/other conifers	
1110	Tamarck and cedar	*Larix* and *Thuja*
1150	Unspecified softwood species	
1200	Poplar/aspen	*Populus*
1201	Trembling aspen	*Populus tremuloides* Michx.
1202	European white poplar	*Populus alba* L.
1203	Balsam poplar	*Populus balsamifera* L.
1204	Black cottonwood	*Populus trichocarpa* Torr. & A. Gray
1205	Eastern cottonwood	*Populus deltoides* Bartr. ex Marsh. ssp. *deltoides*
1206	Largetooth aspen	*Populus grandidentata* Michx.
1207	Carolina poplar	*Populus* × *canadensis* Moench cv. Eugenei
1208	Lombardy poplar	*Populus nigra* L. cv. Italica
1209	Hybrid poplar	*Populus* spp. × *Populus* spp.
1210	Other poplar	*Populus* spp. excluding *P. tremuloides*
1211	Balsam poplar, largetooth aspen & eastern cottonwood	
1212	Balasm poplar & black cottonwood	
1300	Birch	*Betula*
1301	Yellow birch	*Betula alleghaniensis* Britt.
1302	Cherry birch	*Betula lenta* L.
1303	White birch	*Betula papyrifera* Marsh.
1304	Gray birch	*Betula populifolia* Marsh.
1305	Alaska paper birch	*Betula neoalaskana* Sarg.
1306	Mountain paper birch	*Betula cordifolia* Regel
1307	Other birch	*Betula* spp. excluding *B. alleghaniensis*
1308	Alaska paper and white birch	*Betula neoalaskana* Sarg. and *Betula papyrifera* Marsh.
1309	European birch	*Betula pendula* Roth. syn. *B. verrucosa* Ehrh.
1310	White & gray birch	
1400	Maple	*Acer*
1401	Sugar maple	*Acer saccharum* Marsh.
1402	Black maple	*Acer nigrum* Michx.
1403	Bigleaf maple	*Acer macrophyllum* Pursh

Code	Common name	Scientific name
1404	Manitoba maple	*Acer negundo* L.
1405	Red maple	*Acer rubrum* L.
1406	Silver maple	*Acer saccharinum* L.
1407	Norway maple	*Acer platanoides* L.
1408	Sugar and black maple	*Acer saccharum* Marsh. and *Acer nigrum* Michx.
1409	Other maple	*Acer* spp. excluding *A. saccharum* and *A. nigrum*
1410	Striped maple	*Acer pensylvanicum* L.
1411	Mountain maple	*Acer spicatum* Lamb.
1412	Silver and red maple	*Acer platanoides* L. and *Acer rubrum* L.
1500	Other hardwoods/other broad-leaved species	Broad-leaved spp. excluding *Populus, Betula* and *Acer* spp.
1550	Unspecified hardwood species	
1600	Hickory	*Carya*
1601	Bitternut hickory	*Carya cordiformis* (Wangenh.) K. Koch
1602	Red hickory (Pignut hickory)	*Carya glabra* (Mill.) Sweet var. *odorata* (Marsh.) Little
1603	Shagbark hickory	*Carya ovata* (Mill.) K. Koch
1604	Shellbark hickory	*Carya laciniosa* Michx. f.
1700	Walnut	*Juglans*
1701	Butternut	*Juglans cinerea* L.
1702	Black walnut	*Juglans nigra* L.
1800	Alder	*Alnus*
1801	Sitka alder	*Alnus viridis* ssp. *sinuata* (Regel) Á. Löve & D. Löve
1802	Red alder	*Alnus rubra* Bong.
1803	Green Alder	*Alnus incana* ssp. *tenuifolia* (Nutt.) Breit.
1804	Mountain alder	*Alnus viridis* ssp. *crispa* (Ait.) Turrill
1805	Speckled alder	*Alnus incana* ssp. *rugosa* (Du Roi) J. Clausen
1900	Ironwood (hop-hornbeam)	*Ostrya virginiana* (Mill.) K. Koch
1950	Blue-beech (American hornbeam)	*Carpinus caroliniana* Walt.
2000	Beech	*Fagus grandifolia* Ehrh.
2100	Oak	*Quercus*
2101	White oak	*Quercus alba* L.
2102	Swamp white oak	*Quercus bicolor* Willd.
2103	Garry oak	*Quercus garryana* Dougl.
2104	Bur oak	*Quercus macrocarpa* Michx.
2105	Pin oak	*Quercus palustris* Muenchh.
2106	Chinquapin oak	*Quercus muehlenbergii* Engelm.
2107	Chestnut oak	*Quercus montana* Willd.
2108	Red oak	*Quercus rubra* L.
2109	Black oak	*Quercus velutina* Lam.
2110	Northern pin oak	*Quercus ellipsoidelis* E.J. Hill
2111	Shumard oak	*Quercus shumardii* Buckl.
2200	Elm	*Ulmus*
2201	White elm	*Ulmus americana* L.
2202	Slippery elm	*Ulmus rubra* Muhl.
2203	Rock elm	*Ulmus thomasii* Sarg.
2300	Red mulberry	*Morus rubra* L.
2400	Tulip-tree	*Liriodendron tulipifera* L.
2500	Cucumber-tree	*Magnolia acuminata* L.
2600	Sassafras	*Sassafras albidum* (Nutt.) Nees
2700	Sycamore	*Platanus occidentalis* L.
2800	Cherry	*Prunus*

Code	Common name	Scientific name
2801	Black cherry	*Prunus serotina* Ehrh.
2802	Pin cherry	*Prunus pensylvanica* L. f.
2803	Bitter cherry	*Prunus emarginata* Dougl.
2804	Choke cherry	*Prunus virginiana* L. var. *virginiana*
2900	Honey-locust	*Gleditsia triacanthos* L.
2901	Black locust	*Robinia pseudoacacia* L.
3000	Basswood	*Tilia americana* L.
3100	Black-gum	*Nyssa sylvatica* Marsh.
3200	Flowering dogwood	*Cornus*
3201	Eastern flowering dogwood	*Cornus florida* L.
3202	Western flowering dogwood	*Cornus nuttallii* Audubon
3203	Alternate-leaf dogwood	*Cornus alternifolia* L. f.
3300	Arbutus	*Arbutus menziesii* Pursh
3400	Ash	*Fraxinus*
3401	White ash	*Fraxinus americana* L.
3402	Black ash	*Fraxinus nigra* Marsh.
3403	Red ash	*Fraxinus pennsylvanica* Marsh.
3404	Northern red ash	*Fraxinus pennsylvanica* var. *austini* Fern.
3405	Green ash	*Fraxinus pennsylvanica* var. *subintegerrima* (Vahl) Fern.
3406	Blue ash	*Fraxinus quadrangulata* Michx.
3407	Oregon ash	*Fraxinus latifolia* Benth.
3408	Pumpkin ash	*Fraxinus profunda* (Bush) Bush
3500	Willow	*Salix*
3501	Black willow	*Salix nigra* Marsh.
3502	Peachleaf willow	*Salix amygdaloides* Andersson
3503	Pacific willow	*Salix lucida* ssp. *lasiandra* (Benth.) E. Murr.
3504	Crack willow	*Salix fragilis* L.
3505	Shining willow	*Salix lucida* Muhl. ssp. *lucida*
3600	Kentucky coffee tree	*Gymnocladus dioicus* (L.) K. Koch
3700	Hackberry	*Celtis occidentalis* L.
3800	Serviceberry	*Amelanchier* genus
3900	Beaked hazel	*Corylus cornuta* Marsh.
3910	Hawthorn	*Crataegus* genus
3920	Common winterberry (black-alder)	*Ilex verticillata* (L.) A. Gray
3930	Apple	*Malus* genus
3940	Mountain-holly	*Nemopanthus mucronatus* (L.) Trel.
3950	Staghorn sumac	*Rhus typhina* L.
3960	Mountain-ash	*Sorbus* genus
4000	Tolerant hardwoods	Shade-tolerant species like beech, sugar maple, and yellow birch
4500	Upland hardwoods	All tolerant hardwoods except hard maple and lowland hardwoods
5000	Intolerant hardwoods	Shade-intolerant species such as trembling aspen and white birch
5500	Lowland hardwoods	Black ash, white elm, and soft (red) maple

Volume Type

Code	Class
0	Volume zero and no volume expected and because the maturity class was “regeneration” or the age class was less than 20 years it was not appropriate to insert a regional average volume
1	Volume data from the source agency
2	Volume added when volume found to be missing: by phase, forest section, site quality, age class, and first species
3	by forest section, site quality, age class, and first species
4	by forest region, site quality, age class, and first species
5	by forest region, age class, and first species
6	by forest region and first species
7	by forest region
8	By province
-7	Volume zero, land class and all other classes are missing (i.e. no information about whether it is a forested record, or about stocking, age, maturity, etc.)
-6	Volume zero, land class is forest, but all other classes are missing (i.e. no information about stocking class, age, maturity, etc.)
-9	Volume not applicable (not a stocked forest record)

Inventory Phase

Province	Phase #	Description
NL	3	CanFI91 - Island Global
	11	CanFI91 - Island Management
	12	CanFI91 - New Island Management

Utilization Specifications for Volumes

Province/ territory	Type of volume	Minimum dbh (cm)	Top dib (cm)	Stump height (cm)
NL	Gross merchantable	9.0	7.6[a]	15
NS	Gross merchantable	9.0	7.0	15
PE	Gross merchantable	9.0	8.0	15
NB	Gross merchantable	9.1	8.0	15
QC	Gross merchantable	9.0	9.0 [a]	15
ON	Gross merchantable	9.0	7.0	30
MB	Gross merchantable	9.1	7.6	30
SK	Gross merchantable	7.0	7.0	30
AB	Gross merchantable	13.5	10.0	30
BC	Net merchantable	12.5[b] 17.5[c]	10.0	30
YT	Gross merchantable	15.0	10.0	30
NT	Gross merchantable	10.2	10.2	30
NU	Gross merchantable	9.0	9.0	15

[a] The top diameter is measured outside the bark for Newfoundland and Labrador and Quebec

[b] Minimum dbh for lodgepole pine and deciduous leading stands.

[c] Minimum dbh for all other species.

Appendix III. Data Formats

Data Format

Each record in the attribute database has the following format:

Column number	Column name	Data type	
1	PROVINCE	Number (2)	
2	PHASE	Number (4)	
3	SUMMARY UNIT	Varchar2 (10)	
4	MAPPING_LABEL	Varchar2 (10)	
5	ECOZONE	Number (2)	
6	ECOREGION	Number (3)	
7	FOREST_REGION	Number (2)	
8	FOREST_SECTION	Number (5)	
9	BOREAL	Number (1)	
10	OWNERSHIP	Number (2)	
11	STATUS	Number (2)	
12	PROTECTION	Number (1)	
13	LAND_CLASS	Number (5)	
14	SITE_QUALITY	Number (3,1)	
15	STOCKING_CLASS	Number (3)	
16	AGE_CLASS	Number (2)	
17	MATURITY_CLASS	Number (1)	
18	FOREST_TYPE	Number (1)	
19	PREDOMINANT_GENUS	Number (2)	
20	FIRST_SPECIES	Number (4)	
21	AREA	Number	
22	VOLUME_ID	Number (7)	← link to volume tables
23	VOL_TYPE	Number (1)	
24	CONIF_VOL	Number	
25	BROADL_VOL	Number	
26	TOTAL_VOL	Number	
27	CONIF_VPHA	Number	
28	BROADL_VPHA	Number	
29	TOTAL_VPHA	Number	
30	DATA_SOURCE_ID	Number (3)	← link to data source description table
31	ACCESSED	Number (1)	

Volume_id is a link to the species-level volume table for each province. The species detail volumes are stored separately from the area description tables to save space, as not all records in the area table have volume (all the records that are not stocked forest land), and as the same volume record may be used for a number of area records. There are two formats for volume tables. One (volume rank table) lists the species code and species volume in ranked order of volume for each volume_id; the other (volume description table) lists the species code, species volume, and species rank for each volume_id. The latter table facilitates retrievals by species codes, whereas the former resembles the traditional format of volume tables.

Volume description table format:

Column number	Column name	Data type	
1	VOLUME_ID	Number (7)	← link to area table
2	SPECIES1	Number (4)	
3	SP1_VOLUME	Number	
4	SPECIES2	Number (4)	
5	SP2_VOLUME	Number	
6	SPECIES3	Number (4)	
7	SP3_VOLUME	Number	
8	SPECIES4	Number (4)	
9	SP4_VOLUME	Number	
10	SPECIES5	Number (4)	
11	SP5_VOLUME	Number	
12	SPECIES6	Number (4)	
13	SP6_VOLUME	Number	
14	SPECIES7	Number (4)	
15	SP7_VOLUME	Number	
16	SPECIES8	Number (4)	
17	SP8_VOLUME	Number	
18	SPECIES9	Number (4)	
19	SP9_VOLUME	Number	
20	SPECIES10	Number (4)	
21	SP10_VOLUME	Number	
22	SPECIES11	Number (4)	
23	SP11_VOLUME	Number	
24	SPECIES12	Number (4)	
25	SP12_VOLUME	Number	
26	SPECIES13	Number (4)	
27	SP13_VOLUME	Number	
28	SPECIES14	Number (4)	
29	SP14_VOLUME	Number	
30	SPECIES15	Number (4)	
31	SP15_VOLUME	Number	
32	SPECIES16	Number (4)	
33	SP16_VOLUME	Number	
34	SPECIES17	Number (4)	
35	SP17_VOLUME	Number	
36	SPECIES18	Number (4)	
37	SP18_VOLUME	Number	
38	SPECIES19	Number (4)	
39	SP19_VOLUME	Number	
40	SPECIES20	Number (4)	
41	SP20_VOLUME	Number	
42	SPECIES21	Number (4)	
43	SP21_VOLUME	Number	
44	SPECIES22	Number (4)	
45	SP22_VOLUME	Number	
46	SPECIES23	Number (4)	
47	SP23_VOLUME	Number	
48	SPECIES24	Number (4)	
49	SP24 VOLUME	Number	
50	SPECIES25	Number (4)	
51	SP25_VOLUME	Number	
52	SPECIES26	Number (4)	
53	SP26_VOLUME	Number	

Volume rank table format

Column number	Column name	Data type	
1	VOLUME_ID	Number (7)	← link to area table
2	SPECIES_CODE	Number (4)	
3	SPECIES_VOLUME	Number	
4	RANK	Number	

The data source description table contains information about the type of inventory and when it was collected and updated. The format is as follows:

Column number	Column name	Data type	
1	DATA_SOURCE_ID	Number (7)	← link to area table
2	DATA_SOURCE	Number (4)	
3	YEAR_COLLECTED	Number	
4	YEAR_UPDATED	Number	

Canadian Forest Service Contacts

For more information about the Canadian Forest Service, visit our website at
