INTRODUCTION

A collection of named cultures maintained in the Forest Research Laboratory at Fredericton, N. B., serves as a source of known fungi in various mycological and pathological investigations and as an aid in identification work.

Cultures in the collection are grown in 18 x 150 mm tubes, capped with Morton stainless steel test tube caps, on 2% malt extract agar slants. When growth is established the tubes are stored at 5°C in refrigerators. This temperature retards further growth and prevents fast drying of the agar. Transfers of cultures are made periodically. Subcultures of any isolate are available on request.

The cultures are listed alphabetically within taxonomic groups as follows:

Name of fungus and authority

Reference culture number; type of isolation;
host or substratum; locality; year of isolation;
person identifying culture; person confirming
identification (when applicable); source and original
culture number; remarks.

Complete synonymy is not attempted. Cross references are given only when isolates are maintained under names different from those under which they were originally incorporated into the collection.

Code letters are used as follows:

1. Type of isolation

F - Sporophore tissue culture

M - Monosporous culture

P - Polysporous culture

T - Host tissue culture

X - Other - specified under remarks

2. Source and original culture number
