Information Report M-X-163

Canadian Forestry Service — Maritimes

CANADIAN FORESTRY SERVICE — MARITIMES

The Canadian Forestry Service - Maritimes is one of six regional establishments of the Canadian Forestry Service, within Agriculture Canada. The Centre conducts a program of work directed toward the solution of major forestry problems and the development of more effective forest management techniques for use in the Maritime Provinces.

The program consists of three major elements - research and development, technical and information services, and forest resources development. Most research and development work is undertaken in direct response to the needs of forest management agencies, with the aim of improving the protection, growth, and value of the region's forest resource for a variety of consumptive and nonconsumptive uses; studies are often carried out jointly with provincial governments and industry. The Centre's technical and information services are designed to bring research results to the attention of potential users, to demonstrate new and improved forest management techniques, to assist management agencies in solving day-to-day problems, and to keep the public fully informed on the work of the Maritimes Centre.

The forest resources development branch is responsible for development, implementation, and administration of joint federal/provincial forest resources development agreements in the three Maritime provinces, for the creation of employment opportunities in the development of the forest resources, and for providing economic information to landowners and decision-makers for identifying and evaluating forest management alternatives.

Abstract

This report lists light trap catches for 51 lepidopterous forest insects from 16 locations in the Maritimes from 1976 to 1986, inclusive.

Résumé

Ce rapport cite les prises de 51 espèces de lépidoptères forestiers capturés par pièges lumineux à 16 endroits dans les Maritimes, de 1976 à 1986 inclusivement.

Introduction

The Forest Insect and Disease Survey (FIDS) of the Canadian Forestry Service is responsible for monitoring forest conditions and disseminating the results of these surveys to concerned persons through various channels, including reports and publications. One system used to predict trends in population levels and distribution of forest insects that have a moth stage responsive to light, is through a network of strategically placed light traps.

This system evolved gradually over the years with many changes in trap size and shape, light source, locality, etc. Since 1976, a standard trap and light source (45 cm 15 watt cool white fluorescent tube) (Fig. 1) have been used. A few changes in locations have been necessary but these have been kept to a minimum.

Figure 1. A light trap.

Operation of light traps

In conjunction with the Canadian Forestry Service, survey light traps have been operated by Parks Canada of the federal Department of Environment, New Brunswick Department of Natural Resources and Energy, Nova Scotia Department of Lands and Forests, Prince Edward Island Department of Energy and Forestry, forest industry, and private individuals. Since 1983, traps have been operated from late April to the end of November, until the ground is frozen for winter, or the first snowfall that stays on the ground, whichever occurs first. Before 1983, traps began operation between May 15 and June 1.

Each day, the operator of the trap places the catch in a storage-shipping box, and each week mails the box to the FIDS laboratory for insect identification.

Since 1976, 16 light traps have been operated at 21 locations in the Maritime Provinces (Fig. 2). The following are locations with years of operation:

Location	Years of Operation
New Brunswick	
Ashton Hill, Northumberland County	1976-1986
Balmoral, Restigouche County	1976-1986
Canterbury, York County	1976-1986
Fredericton, York County	1976-1986
Fundy National Park, Albert County	1976-1986
Mayfield, Charlotte County	1980-1986
Oak Bay, Charlotte County	1976-1979
Plaster Rock, Victoria County	1976-1986
Nova Scotia	
Big Intervale, Inverness County	1976-1986
Georgeville, Antigonish County	1976-1986
Kejimikujik National Park, Annapolis County	1976-1986
Lawrencetown, Annapolis County	1976-1986
Liverpool, Colchester County	1982-1986
Londonderry, Colchester County	1976-1986
Prince Edward Island	
Breadalbane, Queens County	1978-1986
Charlottetown, Queens County	1976-1977
Coleman, Prince County	1980-1985
Howlan, Prince County	1986
Kilmuir, Kings County	1986
Montague, Kings County	1976-1985
Wellington, Prince County	1976-1979

The species reported here represent nearly all of the species monitored. About half of these have been recorded on an intermittent basis because of their low numbers. One night's catch of 10 moths is the criterion for monitoring these infrequently occurring moth species. The following tables list the catches for each species by location for each year of operation. Light traps not in operation for a particular year are indicated with the abbreviation "N/O". Entries indicated as "-" show that a catch was not recorded for that year and location. The dash does not indicate a catch of zero but shows that numbers were so low the species was not recorded.

Acknowledgements

The authors wish to acknowledge the efforts of K.J. Harrison for his assistance with early drafts of this report, the student assistants who spent many hours in identifying and counting light trap catches and Kevin Hurley and Sue Martin for their valuable assistance with computing problems.
