ABSTRACT

Forest fire statistical records are presented for selected Canadian provinces and territories, Alaska, Sweden and Finland. Figures for fire occurrence and area burned are separated by cause (lightning-caused and man-caused). Record lengths vary but generally run from the advent of organized suppression to the present time.

RÉSUMÉ

Dans ce rapport, le lecteur trouvera des statistiques sur les incendies de forêt dans des provinces choisies et territoires du Canada, en Alaska, en Suède et en Finlande. Les chiffres concernant l'irruption des incendies et les superficies brûlées sont présentés séparément selon les causes, soit ceux causés par la foudre et ceux causés par l'activité humaine. Le nombre d'années pour lesquelles les statistiques sont disponibles est habituellement enregistré à partir du début de la lutte organisée jusqu'à aujourd'hui.

FOREWORD

This report presents, in tabular form, forest fire statistics gathered from Canada, Alaska, Sweden and Finland for use in a paper entitled "Fire Frequencies During the Suppression Period", which was delivered at the Fire in Circumpolar Ecosystems Conference held in Fredericton, New Brunswick in October 1979. Space limitations in the Conference Proceedings precluded the inclusion of these statistics in the paper; hence, summaries were used. However, it was felt that the publication of these statistics, which were gleaned from a variety of sources, would be of interest to forest fire management personnel in the countries involved.

Statistics were limited to those countries, and within Canada, to those provinces with a large percentage of land area classified as boreal forest. Therefore, within Canada, statistics are presented for the provinces of Newfoundland, Quebec, Ontario, Manitoba, Saskatchewan and Alberta, as well as for the Northwest and Yukon territories. Nova Scotia, New Brunswick, Prince Edward Island and British Columbia were not included. Only a very limited amount of information was available from Russia and, consequently, no statistics from that country are presented.

Countries and provinces separate forest fire statistics by administrative boundaries rather than by forest regions or zones. As a result, the statistics presented in this report cover each country or province as a whole and not just that portion of each classified as boreal forest.

Differing record lengths and recording procedures make comparisons between countries or provinces difficult. Early records often did not separate forest fires by causative agency. In both Sweden and Finland a large number of fires are classified as being of unknown cause and, for the purposes of this report, are classified as man-caused. Improved detection capabilities in recent years have resulted in a significant increase in the number of lightning fires reported. In evaluating these statistics the reader should keep in mind that fires are not separated by protection priority zones. (Fire management agencies utilizing these protection zones stratify suppression efforts in order to give greater protection to high-value properties. The result is numerous large fires in low-value areas.)

The following agencies cooperated fully in providing the data included in this report:

United States Department of the Interior, Bureau of Land Management, Alaska State Office

Canada Department of Indian Affairs and Northern Development
Alberta Forest Service

Saskatchewan Department of Tourism and Renewable Resources
Manitoba Department of Natural Resources

Ontario Ministry of Natural Resources

Québec Ministère de l'Énergie et des Ressources

Newfoundland Department of Forest Resources and Lands

Swedish and Finnish Embassies, Ottawa, Canada
