The first forest insect surveys in Ontario were carried out in 1936 from the Dominion Entomological Laboratory in Ottawa and continued from this location until 1944, when the province of Ontario was divided. for the purpose of these surveys, into northern and southern Ontario. In 1945, personnel from Ottawa continued to conduct and report on surveys in the area south of the Algonquin Park and Parry Sound forest districts, while personnel from the Forest Insect Laboratory in Sault Ste. Marie carried out surveys in the area to the north. In 1950 responsibility for reporting insects for all of Ontario fell to the Sault Ste. Marie laboratory. In 1952 the Forest Disease Survey was initiated with headquarters in Maple, Ontario, then was moved to Sault Ste. Marie in 1967. The results of these surveys of insects and diseases are reported in the Annual Report of the Forest Insect and Disease Survey (FIDS) published by Canadian Forestry Service headquarters in Ottawa. tion, annual district and regional reports, begun in 1948, are prepared by FIDS technicians (Rangers) in Sault Ste. Marie. In 1980 a new provincial report was released in Ontario. The contents of the following review have been abstracted from these reports and compiled in alphabetical order by the scientific names of species in each of the following three categories:

Major Insects or Diseases

Capable of causing serious injury to or death of living trees or shrubs.

Minor Insects or Diseases

Capable of causing sporadic or localized injury but not usually a serious threat to living trees or shrubs.

Abiotic Damage

Damage caused by non-living factors.

All measurements in this review are in metric form and conversions from Imperial measurements given in the earliest reports are taken to the second decimal point [i.e. $sq.\ mi.\ to\ km^2$ = area $(sq.\ mi.)$ x 2.59 = area km^2]. Infestation maps in this review were copied from the original maps in the FIDS technicians' reports. Abbreviations for the common names of the host tree species, along with the scientific names, are shown in Appendices A and B. To facilitate the location of hosts, deciduous and coniferous species have been separated and listed alphabetically under the common names.

Appendix C is a series of maps for northwestern Ontario grouped alphabetically by insect species or disease pathogen and showing the location of infestations within a region or infestation boundaries that extend beyond regions.

ACKNOWLEDGMENTS

The authors wish to acknowledge Dr. G.M. Howse, Head, Forest Insect and Disease Survey; Miss C.A. Plexman, Chief, Communications Services; and Mr. P. Jakibchuk, Technical Services Officer, for advice and support during the preparation of this review.

We also wish to acknowledge the following authors of the FIDS district and regional reports from which this review was abstracted:

INTRODUCTION

This is a review of significant forest insects and diseases recorded from 1950 to 1980 in the area currently covered by the Kenora District. This district underwent a significant boundary change in 1973 when a large portion of the former district became part of the Dryden and Fort Frances districts and a small portion of the former Sioux Lookout District was added. In the selection of pests for this report, particular attention was paid to the major working groups of host species in the area, namely, jack pine, white pine, red pine, white spruce, black spruce balsam fir, larch and the tolerant hardwoods (poplar and white birch) as well as some ornamentals and shade trees. The insects and diseases included are capable of causing, or have caused, tree mortality or a reduction in growth. Also included are abiotic problems that cause damage, i.e., drought, frost, wind and winter drying.

SUMMARY

FOREST INSECTS

Eastern Blackheaded Budworm, Acleris variana (Fern.)
page 9

[Major]

No tree mortality has been recorded as caused by this defoliator, which affects primarily spruce, balsam fir and eastern hemlock. Although the insect is widely distributed throughout the district, only low numbers or trace populations have been found, except in 1964, when a light infestation was recorded at one point.

Birch Skeletonizer, Bucculatrix canadensisella Cham. page 9

[Major]

Defoliation by this insect seldom causes mortality of the host but weakened trees are subject to attack by secondary insects and diseases. Large outbreaks of this insect usually last 3 to 4 years, then decline rapidly. Medium-to-heavy infestations were recorded in 1956 and from 1970 to 1973.

Large Aspen Tortrix, Choristoneura conflictana (Wlk.) [Major] page 11

No tree mortality has been recorded as caused by this defoliator, which affects primarily aspen and poplar. A light infestation occurred in 1970 and moderate-to-severe damage was recorded in 1971. Trace populations were reported in 1964, 1973 and 1974. Spruce Budworm, Choristoneura fumiferana (Clem.) pages 13-14

[Major]

This insect is considered the most destructive insect pest of several coniferous hosts in eastern Canada; the main hosts are white spruce and balsam fir. Though not major hosts, black spruce, eastern hemlock and tamarack are attacked and considerable tree mortality can occur. Moderate-to-heavy infestations occurred from 1950 to 1958, and again in 1980. Tree mortality was recorded in 1951 and the area affected increased until 1958, at which time budworm-killed trees could be found in many stands throughout the district.

Jack Pine Budworm, Choristoneura pinus pinus Free. page 28

[Major]

This is a destructive pest of pines that can cause mortality after about two years of severe defoliation. Medium-to-heavy infestations were recorded in 1954, 1961 and 1962, and from 1964 to 1968. Small numbers were observed in 1950, 1955, 1969, 1974, 1979 and 1980.

Aspen Twoleaf Tier, Enargia decolor (Wlk.) page 34

[Major]

No tree mortality has been recorded as caused by this defoliator, which affects aspen and cottonwood; however, heavy defoliation reduces growth and vigor and leaves host trees susceptible to attack by other pests. Outbreaks of this insect last only a few years. Pockets of moderate-to-severe defoliation, intermingled with pockets of light defoliation, occurred in 1959 and high populations were recorded in 1969. Light damage was evident in 1960, 1962 and 1970.

Eastern Pine Shoot Borer, Eucosma gloriola Heinr. pages 34-35

This insect usually infests lateral shoots and causes only aesthetic damage. When high populations develop, some leaders are infested and killed, and this causes deformity of the infested trees. Moderate-to-severe leader damage occurred in 1964 and 1965. Light infestations were recorded in 1959, 1960, 1979 and 1980.

Forest Tent Caterpillar, Malacosoma disstria Hbn. pages 35-36

[Major]

This caterpillar is widely distributed through North America. Infestations usually last an average of five years and high populations denude large areas of susceptible stands. The principal host attacked is aspen; however, many other deciduous species also suffer severe defoliation. Repeated defoliation reduces growth and vigor of trees and leaves the host susceptible to attack by other pests. High populations occurred in parts of the district from 1950 to 1953, from 1961 to 1965 and from 1975 to 1979.

Balsam Fir Sawfly, Neodiprion abietis complex pages 52-53

[Major]

Severe defoliation caused by this sawfly can result in mortality of balsam fir and white spruce trees when an infestation persists over a period of time. Medium-to-heavy infestations occurred in 1956, 1961, 1966 and 1967. Pockets of light infestation or trace populations were recorded occasionally as well.

Pine Sawflies: Red Pine Sawfly, Neodiprion nanulus nanulus Schedl.,
Jack Pine Sawfly, Neodiprion pratti banksianae Roh.,
Swaine Jack Pine Sawfly, Neodiprion swainei Midd.,
and Redheaded Jack Pine Sawfly, Neodiprion virginianus
complex

pages 53-56

The sawflies listed are capable of causing mortality of semimature and plantation pine trees when populations are high. Although small pockets of medium-to-heavy infestation were observed occasionally, there is no record of mortality from 1960 to 1980.

Aspen Leafblotch Miner, Phyllonorycter ontario (Free.) [Major] pages 56-57

Although this insect has not been known to cause tree mortality, severe browning of foliage over a period of years can cause a reduction in growth. High populations were present in aspen regeneration stands from 1950 to 1952, from 1961 to 1963, and in 1966, 1969, 1972 and 1980.

Yellowheaded Spruce Sawfly, Pikonema alaskensis (Roh.) [Major] pages 58-59

This destructive insect has been categorized as a serious pest of young spruce plantations and open-growing ornamentals. High mortality can occur after successive years of severe defoliation. High numbers were reported at scattered points from 1955 to 1959, from 1961 to 1963, in 1966 and 1967 and from 1977 to 1980.

White Pine Weevil, *Pissodes strobi* (Peck) page 60

[Major]

This weevil is considered to be the most destructive pest of white pine in North America. Successive weeviling over a period of years results in multiple-stemmed trees. Varying degrees of damage occurred most years from 1954 to 1980.

Larch Sawfly, Pristiphora erichsonii (Htg.) pages 60-62

[Major]

The larch sawfly is the primary defoliating insect of native and most exotic species of larch. On good sites, larch trees can withstand six to nine years of severe defoliation before mortality occurs; on less favorable sites, mortality may follow three or more years of complete defoliation. High populations caused moderate-to-severe defoliation in larch stands at many points from 1950 to 1953, from 1955 to 1959, from 1964 to 1967, and in 1970 and 1971. There was no evidence of tree mortality.

Other Noteworthy Insects page 62

[Major and Minor]

Insects that have the potential for causing damage to stands, regeneration and plantations.

FOREST DISEASES

Armillaria Root Rot, Armillaria mellea (Vahl:Fr.) Kummer [Major]
page 71

This root rot disease oftern kills trees previously stressed by drought, insects, other pathogens or unfavorable environment. However, under some circumstances the fungus, or certain strains of the fungus, can kill vigorous trees. Both deciduous and coniferous trees are attacked. Only trace mortality caused by the pathogen could be found from 1950 to 1980 even though extensive surveys were carried out over several years.

Dutch Elm Disease, Ceratocystis ulmi (Buism.) C. Moreau page 71

[Major]

This major disease organism, which affects all species of elm, was first recorded in Ontario in Prescott County in 1946, and has gradually spread throughout most of the known range of elm in Ontario. The disease was recorded for the first time in the district in 1980.

Needle Rusts, Chrysomyxa ledi (Alb. & Schwein) de Bary [Major] C. ledicola (Peck) Lagerh.

page 72

These, the most widely spread rusts in the Canadian boreal forest, are of concern on mature trees, but the potential for damage in nurseries can be high as well. Varying levels of infection were reported in most years, with the exception of 1952, 1953, 1956, 1958. 1961, 1969 and 1971.

Ink Spot, Ciborinia whetzelii (Seaver) Seaver page 73

[Major]

[Major]

This ink spot disease is widespread throughout the range of aspen. Many poplar species and hybrids are susceptible, but trembling aspen is most commonly affected. Heavily infected trees may be defoliated prematurely and repeated attacks can reduce increment and even kill regeneration. Medium-to-heavy foliar damage occurred in 1962. In other years when the disease was reported only trace or low levels of infection were evident.

Rusts of Pine: Needle Rust of Pine, Coleosporium asterum (Dietel) Sydow, Cronartium quercuum (Berk.) Miyabe ex Shirai f.sp. banksianae, and Western Gall Rust, Endocronartium harknessii

(J.P. Moore) Y. Hirats.

pages 73-75

These rusts may kill trees outright or make them more susceptible to insects, decay and wind breakage depending on he degree of infection. The western gall rusts on jack pine are widely distributed in the district. High levels of infection were reported in 1974 and 1979. Medium-to-heavy infection by Coleosporium asterum was reported in 1966.

White Pine Blister Rust, Cronartium ribicola J.C. Fischer [Major] page 76

White pine blister rust is the most serious disease of eastern white pine. The disease causes top killing and mortality in trees of all ages. The pathogen is present throughout the range of the host in the district. A high incidence of infection was recorded in 1958, 1960 and 1974.

Needle Cast, Davisomycella ampla (Davis) Darker pages

[Major]

This pathogen causes severe defoliation when incidence is high. In years of severe defoliation, trees are weakened and growth reduced. Infection can be so severe that all but the current year's foliage may be cast off. Moderte-to-severe needle cast occurred at one point in the district in 1966 and in many stands in 1972.

Hypoxylon Canker, Hypoxylon mammatum (Wahlenb.) J. Miller [Major] page 77

Mortality caused by this desease is usually restricted to trees in the 7-cm to 13-cm diameter class, growing on poor sites, but branch and top mortality may occur in trees of greater diameter. Varying degrees of infection by the pathogen can be found in immature trembling aspen stands throughout the district.

Shoot Blight, Sirococcus conigenus (DC.) P. Cannon & Minter [Major] page 78

This pathogen is capable of killing trees outright in many age classes and is especially serious in young understory regeneration. The principal host is red pine, although other pines are susceptible to attack. Damage caused by the disease was first recorded in the district in 1973. New areas of infection were reported in 1974, 1976 and 1978.

Shoot Blight, Venturia macularis (Fr.) E. Müller & v. Arx [Major] page 80

Reduced stocking of aspen regeneration occurs when the incidence of this disease is high. Trees more than five years old are seldom affected and, therefore, the disease is of little economic importance in natural stands. When leaders are attacked the pathogen causes reduced height growth and deformed trees. Repeated attack on leaders and lateral shoots will cause mortality. In 1977, 77% of the leaders were killed in one stand.

Other Noteworthy Diseases pages 81-83

These are diseases with the potential for causing damage to natural stands, regeneration and plantations.

ABIOTIC DAMAGE

pages 87-90

Abiotic damage is caused by a variety of influences, e.g., drought, frost, wind, and winter drying. Weakened trees are susceptible to any of a number of insects and diseases. Damage has been reported periodically since 1965.

1965-1969 not reported

1970 Light defoliation occurred at three locations in Phillips,

Redditt and Melick twps.

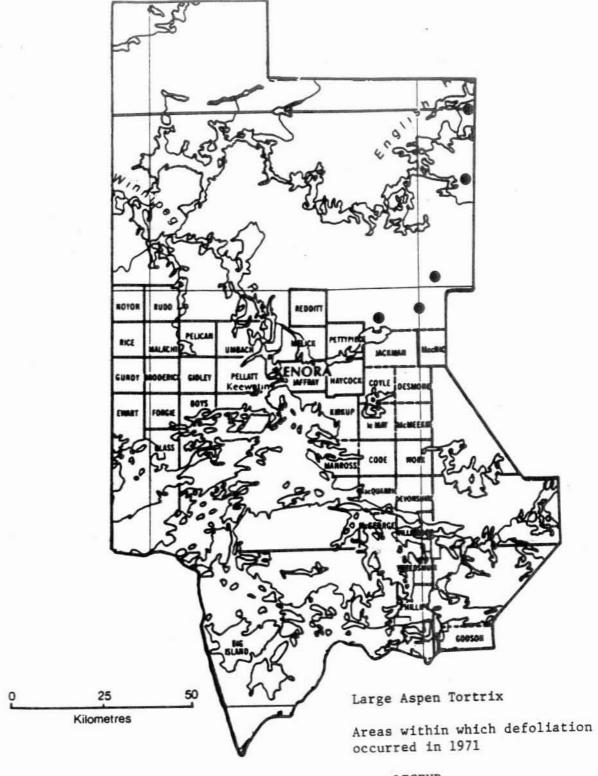

1971 Moderate-to-severe defoliation occurred over a large area

northeast of Kenora (see map, page 12).

1972 The infestation collapsed.

1973-1974 trace populations

1975-1980 not reported

LEGEND

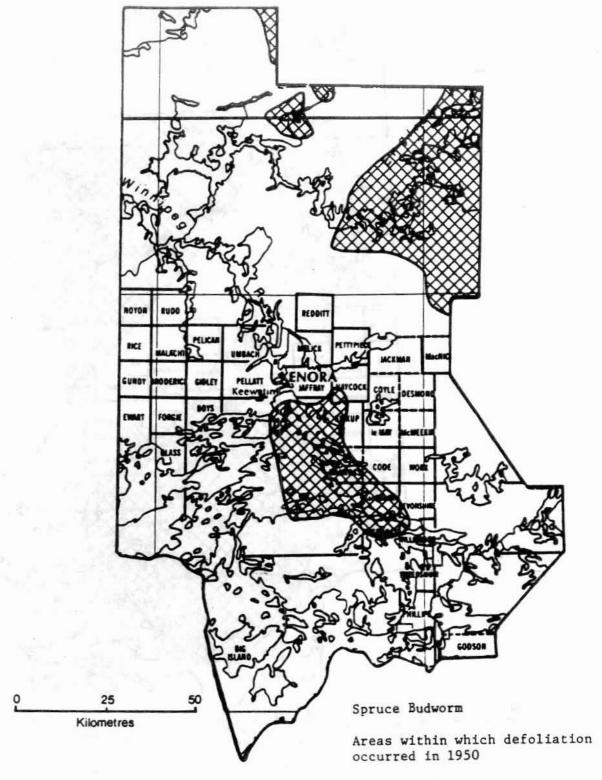

Spruce Budworm, Choristoneura fumiferana (Clem.)

Host(s):	spruce, fir [Major]
Year	Remarks
1950	Moderate-to-severe defoliation occurred throughout the northeastern part of the district and south of Kenora (see map, page 15).
1951	Moderate-to-severe defoliation recurred over a large section of the district (see map, page 16) and tree mortality occurred at the north end of the district (see map, page 17).
1952	Moderate-to-severe defoliation recurred over most of the district (see map, page 18).
1953	Moderate-to-severe defoliation was common, except in the western part of the district (see map, page 19).
1954	Moderate-to-severe defoliation recurred over much of the district (see map, page 20).
1955	Heavy infestations persisted and tree mortality continued to increase (see map, page 21).
1956	Moderate-to-severe defoliation was general over most of the district (see map, page 22) and tree mortality con- tinue to increase (see map, page 23).
1957	Slight increases in the area of moderate-to-severe defoli- ation were noted (see map, page 24).
1958	Moderate-to-severe defoliation was found throughout most of the district (see map, page 25).
1959	A pronounced decline in population levels occurred (see map, page 26).
1960	The infestation collapsed totally. Balsam fir mortality, as a result of several years of infestation, was evident throughout most of the district (see map, page 27).
1961-1964	not reported
1965-1968	trace populations
1969	low numbers of white spruce in MacNicol Twp

1950	Varying degrees of infestation were found throughout the central part of the district.
1951-1953	not reported
1954	A new area of moderate-to-severe defoliation occurred along the east shore of Maynard Lake.
1955	The Maynard Lake infestation was reduced to light levels.
1956-1960	not reported
1961	A medium-to-heavy infestation occurred in the eastern part of the district along the Dryden district boundary. Five small areas of light damage were reported outside the main infestation (see map, page 29).
1962	The area of mederate-to-severe defoliation broke up into several smaller areas (see map, page 30).
1963	Populations were reduced again. Only one pocket of light infestation occurred, at Otterskin Lake.
1964-1965	A small area of medium-to-heavy infestation extended eastward from the Atikokan and Rainmaker lakes area to the Dryden district boundary.
1966	A major outbreak of the insect occurred and moderate-to- severe defoliation was recorded across the entire southern half of the district (see map, page 31).
1967	The infestation persisted across most of the district (see map, page 32).
1968	Moderate-to-severe defoliation was recorded across much of the eastern part of the district (see map, page 33).
1969	The infestation collapsed; few insects were found.

1968-1977	not reported	
1978	trace populations	
1979	3% leader mortality on Gundy Lake Road	
1980	3% leader mortality in Gundy Twp	

Forest Tent Caterpillar, Malacosoma disstria Hbn.

Host(s):	deciduous [Major]
Year	Remarks
1950	There were three relatively small areas of moderate-to- severe defoliation (see map, page 37).
1951	The 1950 infestation expanded slightly (see map, page 38).
1952	The infestation expanded to include all but a relatively small section in the northwestern part of the district (see map, page 39).
1953	Moderate-to-severe defoliation was common throughout the southern part of the district (see map, page 40).
1954	The infestation collapsed.
1955-1959	not reported
1960	A pocket of medium-to-heavy infestation occurred southeast of Minaki, and small areas of light infestation were recorded at several points elsewhere (see map, page 41).
1961	Population levels increased, particularly in the Kenora area (see map, page 42).

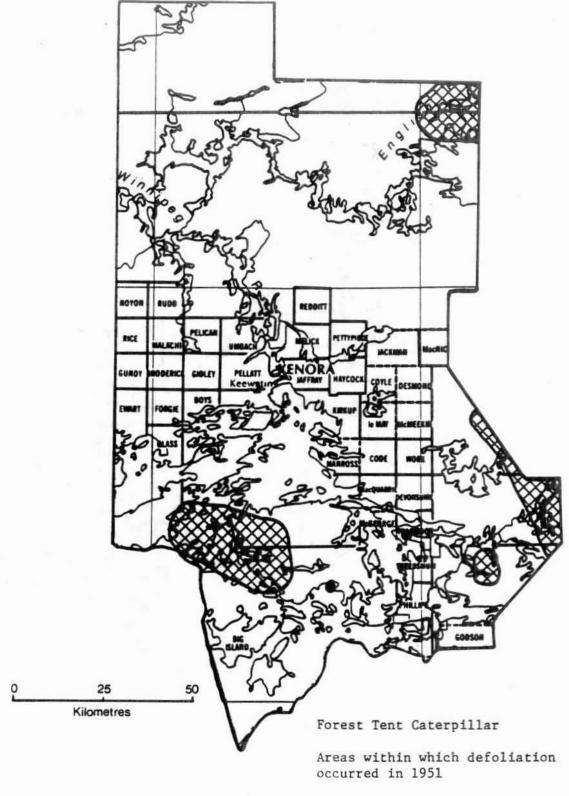

Forest Tent Caterpillar, Malacosoma disstria Hbn. (concl.)

Host(s): dec	iduous [Major]
Year	Remarks
1962	Infestations continued to expand and there were extensive areas of severe defoliation (see map, page 43).
1963	Moderate-to-severe defoliation recurred over most of the district (see map, page 44).
1964	Light defoliation was recorded in the Lake of the Woods area and moderate-to-severe defoliation occurred throughout the remainder of the district (see map, page 45).
1965	There was little change in the infestation boundaries (see map, page 46).
1966	The infestation collapsed as a result of weather conditions.
1967-1974	not reported
1975	Moderate-to-severe damage occurred in the extreme north- western section of the district (see map, page 47).
1976	The infestation expanded to include almost all of the northwestern section of the district (see map, page 48).
1977	The infestation continued to expand (see map, page 49).
1978	Moderate-to-severe defoliation was found throughout the district except in a small area in the southeastern corner (see map, page 50).
1979	A marked reduction in the size and intensity of the infestation occurred (see map, page 51).
1980	The infestion collapsed.

1970	trace leader damage in white pine plantations
1971-1973	not reported
1974	7% leader damage at one point (Access Rd. 314)
1975	Damage declined to 4% at the 1974 location.
1976-1978	not reported
1979	4% of jack pine regeneration suffered leader damage on Gundy Lake Road

leader damage of 3% in Gundy Twp

Larch Sawfly, Pristiphora erichsonii (Htg.)

1980

Host(s):	tL	[Major]
Year		Remarks
1950		Moderate-to-severe defoliation, affecting up to 70% of the stand, was common throughout the eastern part of the district, from Redditt Twp in the north to Godson Twp in the south.
1951		Although populations were slightly lower than in 1950, moderate-to-severe defoliation was general throughout the central part of the district.
1952		Infestation intensities continued to decline and severe defoliation was confined to Jaffray Twp.
1953		Moderate-to-severe defoliation was general throughout the eastern part of the district; this reflected a substantial increase in population levels.
1954		Populations declined sharply and light defoliation was general throughout the eastern and central parts of the district.

Larch Sawfly, Pristiphora erichsonii (Htg.) (cont'd)

Host(s): tL	[Major]
Year	Remarks
1955	Medium-to-heavy infestation occurred in small stands in Haycock, Jackman and MacNicol twps; at other locations only light defoliation occurred.
1956	Mederate-to-severe defoliation occurred in small larch stands in Willingdon Twp and light defoliation was ob- served along Highway 71 south of Kenora.
1957	Medium-to-heavy infestations occurred in the northern part of the district and lightly defoliated trees were common along Highway 71 south of Kenora.
1958	Moderate-to-severe defoliation occurred in Ewart Twp and at several points in the central part of the district.
1959	Population levels were comparable to those found in 1958.
1960	Infestations were generally light with a pocket of medium- to-heavy infestation in Ewart Twp.
1961	Only light infestations were found.
1962	Lightly infested trees were observed in Devonshire and LeMay twps.
1963	trace populations
1964	One pocket of heavy infestation occurred in Willingdon Twp and pockets of light infestation were reported at several points elsewhere.
1965	Medium-to-heavy infestations occurred in Ewart, Haycock, and MacNicol twps and near Sioux Narrows.
1966	Moderate-to-severe defoliation was recorded in MacNicol,
	Kirkup and Devonshire twps and near Pistol Lake, along the Minaki Road.
1967	Medium-to-heavy infestations were present in Jaffray Twp and at several points between Highway 17 and Minaki and between Longbow Corners and Sioux Narrows.
1968	Populations declined, light infestations were found in the Kenora and Sioux Narrows areas.

Year	Remarks
1950-1972	not reported
1973	This year marked the first record of this pathogen in the district; light damage was observed at two points in the southern part of the district (see map, page 79).
1974	Three new infection centers were found in the northern half of the district. Light damage was evident at each point.
1975	Light damage to current shoots occurred at each infection center.
1976	A new infection center was found in planted red pine trees east of Kenora.
1977	not reported
1978	A new infection center was discovered at Rushing River Provincial Park.
1979-1980	not reported

KENORA DISTRICT

LEGEND

Infection centers

Shoot Blight, Venturia macularis (Fr.) E. Müller & v. Arx

Host(s): tA	[Major]
Year	Remarks
1950-1952	not reported
1953	trace infection, Redditt Twp
1954	trace infections
1955	found commonly on small aspen throughout the district
1956	not reported
1957-1959	commonly observed throughout the district
1960-1961	not reported
1962	Medium-to-heavy infection occurred at two locations in the district.
1963	Trace infections were common on aspen regeneration.
1964	32% of trees affected at Sabaskong Bay, Lake of the Woods
1965	On average, 33% of leaders were affected at three locations.
1966-1970	trace and light infections
1971	not reported
1972	trace and light infections
1973-1974	not reported
1975-1976	Light infections were common throughout the district.
1977	Leader mortality of 77% occurred on aspen regeneration along Dryberry Lake Road.
1978	light infections
1979	10% leader mortality at Hillock Lake
1980	not reported

Other Noteworthy Diseases

[Major]

Eastern Dwarf Mistletoe, Arceuthobium pusillum Peck

Host(s): spruce

Year	Remarks
1950-1952	not reported
1953	A low incidence of mistletoe infection was common in black spruce stands in lowlying areas throughout the district.
1954	light damage observed in Godson Twp
1955-1966	not reported
1967	Light tree mortality was recorded in Jaffray Twp.
1968	High levels of infection occurred at scattered points in Jaffray and Devonshire twps and in the Stewart Lake area.
1969	Quantitative sampling revealed 57% and 61% incidence of infection in sample areas in Jaffray and McMeekin twps, respectively.
1970-1972	not reported
1973	widespread at a low level of infection throughout the district
1974-1980	not reported

Shoot Blight, Pollaccia elegans Servit

Host(s): bPo	[Minor]
--------------	---------

<u>Year</u>	Remarks
1950-1958	not reported
1959-1960	Light damage was recorded at Miles Bay on Lake of the Woods.
1961	low infection levels at many points in the district
1962-1964	not reported
1965	Light damage occurred at widely separated points.
1966	not reported
1967	light damage at scattered locations
1968-1970	not reported
1971	low incidence of damage common in the district
1972-1980	not reported

Fireweed Rust, Pucciniastrum epilobii Otth

not reported

Host(s): bF

1969

Year	Remarks		
1950-1962	not reported		
1963	light infections at scattered points		
1964-1965	one point of light infection		
1966	A small area of medium-to-heavy infection was reported in Work Twp, and light damage occurred on Rabbit Point Island in Lake of the Woods.		
1967	In Willingdon Twp, 41% of the shoots were infected.		
1968	light infections		

(cont'd)

[Minor]

Fireweed Rust, Pucciniastrum epilobii Otth (concl.)

Host(s): bF

[Minor]

	9 - 1
Year	Remarks
1970-1971	trace infections
1972	not reported
1973	light levels of infection near Sioux Narrows
1974	light infections at several points in Lake of the Woods
1975-1980	not reported

ABIOTIC DAMAGE

Drought

Remarks Year 1950-1964 not reported Pines were moderately to severely damaged on islands and 1965 in shoreline stands throughout an area of approximately 1,900 km2 in Lake of the Woods. Mortality in affected jack pine stands ranged from 22% to 51%. 1966-1969 not reported 1970 White birch regeneration growing on shallow or high, rocky sites was seriously damaged at many points in the district. Serious damage to white birch regeneration growing on 1971 high, rocky sites recurred at many points in the district. 1972-1973 not reported White birch and jack pine regeneration growing on exposed 1974 islands in Lake of the Woods and on high, rocky sites at many points elsewhere in the district were moderately to severely damaged. 1975-1980 not reported

Frost

Remarks Year not reported 1950-1952 Moderate-to-severe foliar damage on trembling aspen and 1953 light damage on larch occurred in many stands throughout the district. 1954-1963 not reported 1964 Pockets of moderate-to-severe damage occurred in Redditt Twp and along the Jones Road. The most serious injury occurred to balsam fir and white spruce; light damage was observed on trembling aspen as well. 1965 Moderate-to-severe damage to current shoots of balsam fir and white spruce was evident at many locations. grown and fringe trees suffered the most injury. 1966-1977 not reported 1978 Moderate-to severe damage to the current foliage of balsam fir and spruce was evident on open sites and on fringes of stands. 1979-1980 not reported

Wind

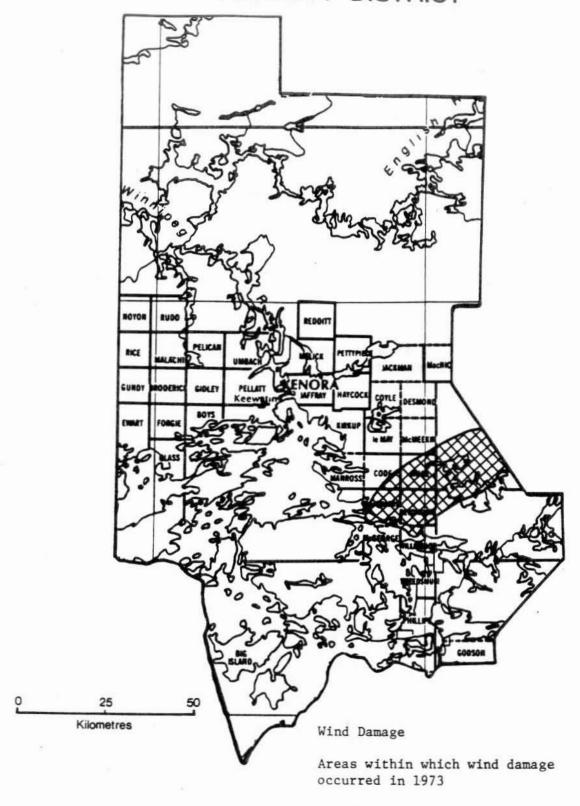

Year

1973 Moderate-to-severe damage occurred to all tree species in an area of approximately 240 km² in a strip extending from the southeastern part of Lake of the Woods to the eastern district boundary in the Dryberry Lake area (see map, page 89).

Remarks

1974-1980 not reported

KENORA DISTRICT

LEGEND

Moderate-to-severe damage

Winter Drying

Year	Remarks
1950-1964	not reported
1965	Foliar damage occurred in widely scattered white pine and jack pine plantations. The highest incidence of damage was evident on southerly slopes and in open areas.
1966	not reported
1967	Moderate-to-severe damage was recorded in white pine and red pine plantations in Jaffray and Willingdon twps.
1968-1969	not reported
1970	Surveys along the Jones Road revealed that up to 17.5% of young red pine and white pine trees were damaged in the area.
1971-1976	Moderate-to-severe foliar damage was evident on young red pine and balsam fir trees on open sites at widely scattered points.
1977-1980	not reported
